Customer scenarios

Overview

[Previous: Performance tuning.](#)

This section describes customer scenarios and their architectures.

[Next: Data lake to ONTAP NFS.](#)

Data lake to ONTAP NFS

[Previous: Customer scenarios.](#)

This use case is based on the largest financial customer proof of concept (CPOC) that we have done. Historically, we used the NetApp In-Place Analytics Module (NIPAM) to move analytics data to NetApp ONTAP AI. However, because of recent enhancements and the improved performance of NetApp XCP as well as the unique NetApp data mover solution approach, we reran the data migration using NetApp XCP.

Customer challenges and requirements

Customer challenges and requirements that are worth noting include the following:

- Customers have different types of data, including structured, unstructured, and semistructured data, logs, and machine-to-machine data in data lakes. AI systems require all these types of data to process for prediction operations. When data is in a data lake-native file system, it is difficult to process.
- The customer's AI architecture is not able to access data from Hadoop Distributed File System (HDFS) and Hadoop Compatible File System (HCFS), so the data is not available to AI operations. AI requires data in an understandable file system format such as NFS.
- Some special processes are required to move data from the data lake because of the large amount of data and high-throughput, and a cost-effective method is required to move the data to the AI system.

Data mover solution

In this solution, the MapR File System (MapR-FS) is created from local disks in the MapR cluster. The MapR NFS Gateway is configured on each data node with virtual IPs. The file server service stores and manages the MapR-FS data. NFS Gateway makes Map-FS data accessible from the NFS client through the virtual IP. An XCP instance is running on each MapR data node to transfer the data from the Map NFS Gateway to NetApp ONTAP NFS. Each XCP instance transfers a specific set of source folders to the destination location.

The following figure illustrates the NetApp data mover solution for MapR cluster using XCP.

For detailed customer use cases, recorded demos, and test results, see the [Using XCP to Move Data from a Data Lake and High-Performance Computing to ONTAP NFS](#) blog.

For detailed steps on moving MapR-FS data into ONTAP NFS by using NetApp XCP, see Appendix B in [TR-4732: Big Data Analytics Data to Artificial Intelligence](#).

Next: [High-performance computing to ONTAP NFS](#).

High-performance computing to ONTAP NFS

Previous: [Data lake to ONTAP NFS](#).

This use case is based on requests from field organizations. Some NetApp customers have their data in a high-performance computing environment, which provides data analytics for training models and enables research organizations to gain insight and understanding of large amount of digital data. NetApp field engineers need a detailed procedure to extract the data from IBM's GPFS to NFS. We used NetApp XCP to migrate the data from GPFS to NFS so that GPUs can process the data. AI typically processes data from a network file system.

For more information about the high-performance computing to ONTAP NFS use case, a recorded demo, and test results, see the [Using XCP to Move Data from a Data Lake and High-Performance Computing to ONTAP NFS](#) blog.

For detailed steps on moving MapR-FS data into ONTAP NFS by using NetApp XCP, see Appendix A: GPFS to NFS—Detailed Steps in [TR-4732: Big Data Analytics Data to Artificial Intelligence](#).

Next: [Using the XCP Data Mover to migrate millions of small files to flexible storage](#).

Using the XCP Data Mover to migrate millions of small files to flexible storage

Previous: [High-performance computing to ONTAP NFS](#).

This use case is based on the largest NetApp tourism industry customer for on-premises-to-cloud data migration. Because COVID-19 has reduced demand in the travel industry, customers want to save capital expenses on high-end storage in their on-premises environment for the demand pricing application. This customer has a tight SLA to migrate millions of small files to the cloud.

The following figure depicts data migration from on-premises to Azure NetApp Files for small files.

For more information, see the [NetApp XCP Data Mover Solution: On Premises to Cloud](#) blog.

Next: [Using the XCP Data Mover to migrate large files.](#)

Using the XCP Data Mover to migrate large files

Previous: [Using the XCP Data Mover to migrate millions of small files to flexible storage.](#)

This use case is based on a television network customer. The customer wanted to migrate Oracle Recovery Manager (RMAN) backup files to the cloud and run the Oracle E-Business Suite (EBS) application by using Azure NetApp Files with Pacemaker software. The customer also wanted to migrate their database backup files to on-demand cloud storage and transfer large files (in the range of 25GB to 50GB each) to Azure.

The following figure illustrates the data migration from on-premises to Azure NetApp Files for large files.

For more information, see the [NetApp XCP Data Mover Solution: On Premises to Cloud](#) blog.

Next: [Duplicate files.](#)

Duplicate files

Previous: [Using the XCP Data Mover to migrate large files.](#)

NetApp received a request to find duplicate files from a single volume or multiple volumes. NetApp provided the following solution.

For single volume, run the following commands:

```
[root@mastr-51 linux]# ./xcp -md5 -match 'type==f and nlinks==1 and size
!= 0' 10.63.150.213:/common_volume/nfsconnector_hw_cert/ | sort | uniq -cd
--check-chars=32
XCP 1.5; (c) 2020 NetApp, Inc.; Licensed to Calin Salagean [NetApp Inc]
until Mon Dec 31 00:00:00 2029

176,380 scanned, 138,116 matched, 138,115 summed, 10 giants, 61.1 GiB in
(763 MiB/s), 172 MiB out (2.57 MiB/s), 1m5s

Filtered: 38264 did not match
176,380 scanned, 138,116 matched, 138,116 summed, 10 giants, 62.1 GiB in
(918 MiB/s), 174 MiB out (2.51 MiB/s), 1m9s.
    3 00004964ca155eca1a71d0949c82e37e
nfsconnector_hw_cert/grid_01082017_174316/0/hadoopqe/accumulo/shell/pom.xml
1
    2 000103fbed06d8071410c59047738389
nfsconnector_hw_cert/usr_hdp/2.5.3.0-37/hive2/doc/examples/files/dim-
data.txt
    2 000131053a46d67557d27bb678d5d4a1
nfsconnector_hw_cert/grid_01082017_174316/0/log/cluster/mahout_1/artifacts
/classifier/20news_reduceddata/20news-bydate-test/alt.atheism/53265
```

For multiple volumes, run the following commands:

```
[root@mastr-51 linux]# cat multiplevolume_duplicate.sh
#!/usr/bin/bash

#user input
JUNCTION_PATHS='/nc_volume1 /nc_volume2 /nc_volume3 /oplogarchivevolume'
NFS_DATA_LIF='10.63.150.213'

#xcp operation
for i in $JUNCTION_PATHS
do
echo "start - $i" >> /tmp/duplicate_results
/usr/src/xcp/linux/xcp -md5 -match 'type==f and nlinks==1 and size != 0'
${NFS_DATA_LIF}:$i | sort | uniq -cd --check-chars=32 | tee -a
/tmp/duplicate_results
echo "end - $i" >> /tmp/duplicate_results
done

[root@mastr-51 linux]# nohup bash +x multiplevolume_duplicate.sh &
[root@mastr-51 linux]# cat /tmp/duplicate_results
```

[Next: Specific date-based scan and copy of data.](#)

Specific date-based scan and copy of data

[Previous: Duplicate files.](#)

This solution is based on a customer who needs to copy data based on a specific date. Verify the following details:

Created a file in Y: and checked the scan command to list them.

```
c:\XCP>dir Y:\karthik_test
Volume in drive Y is from
Volume Serial Number is 80F1-E201

Directory of Y:\karthik_test

05/26/2020  02:51 PM    <DIR>          .
05/26/2020  02:50 PM    <DIR>          ..
05/26/2020  02:51 PM                2,295 testfile.txt
                1 File(s)                2,295 bytes
                2 Dir(s)          658,747,392 bytes free
```

```
c:\XCP>
```

```
c:\XCP>xcp scan -match "strftime(ctime,'%Y-%m-%d')>'2020-05-01'" -fmt
'{}'.format(iso(mtime),name)" Y:\
XCP SMB 1.6; (c) 2020 NetApp, Inc.; Licensed to Calin Salagean [NetApp
Inc] until Mon Dec 31 00:00:00 2029
```

It appears that you are not running XCP as Administrator. To avoid access issues please run XCP as Administrator.

```
2020-05-26_14:51:13.132465,testfile.txt
2020-05-26_14:51:00.074216,karthik_test
```

```
xcp scan -match strftime(ctime,'%Y-%m-%d')>'2020-05-01' -fmt
'{}'.format(iso(mtime),name) Y:\ : PASSED
30,205 scanned, 2 matched, 0 errors
Total Time : 4s
STATUS : PASSED
```

Copy the files based on date (2020 YearMay month first date) from Y: to Z:

```
c:\XCP>xcp copy -match "strftime(ctime,'%Y-%m-%d')>'2020-05-01'" Y:
Z:\dest_karthik
```

XCP SMB 1.6; (c) 2020 NetApp, Inc.; Licensed to Calin Salagean [NetApp Inc] until Mon Dec 31 00:00:00 2029

It appears that you are not running XCP as Administrator. To avoid access issues please run XCP as Administrator.

```
30,205 scanned, 3 matched, 0 copied, 0 errors, 5s
xcp copy -match strftime(ctime,'%Y-%m-%d')>'2020-05-01' Y: Z:\dest_karthik
: PASSED
30,205 scanned, 3 matched, 2 copied, 0 errors
Total Time : 6s
STATUS : PASSED
```

c:\XCP>

Check the destination Z:

```
c:\XCP>dir Z:\dest_karthik\karthik_test
Volume in drive Z is to
Volume Serial Number is 80F1-E202
```

Directory of Z:\dest_karthik\karthik_test

```
05/26/2020  02:51 PM    <DIR>          .
05/26/2020  02:50 PM    <DIR>          ..
05/26/2020  02:51 PM                2,295 testfile.txt
                1 File(s)                2,295 bytes
                2 Dir(s)          659,316,736 bytes free
```

c:\XCP>

[Next: Creating a CSV file from SMB/CIFS share.](#)

Creating a CSV file from SMB/CIFS share

[Previous: Specific date-based scan and copy of data.](#)

The following command dumps data in the CSV format. You can sum up the size column to get the total size of the data.

```
xcp scan -match "((now-x.atime) / 3600) > 31*day" -fmt "'{ }, { }, { },
{ }'.format(relpath, name, strftime(x.atime, '%Y-%m-%d-%H:%M:%S'),
humanize_size(size))" -preserve-atime >file.csv
```

The output should look similar to this example:

```
erase\report_av_fp_cdot_crosstab.csvreport_av_fp_cdot_crosstab.csv20-01-29-10:26:2449.6MiB
```

To scan up to the depth of three subdirectories and provide the result in sorting order, run the `xcp -du` command and dump the size at each directory level up to the depth of three subdirectories.

```
./xcp scan -du -depth 3 NFS_Server_IP:/source_vol
```

To sort, dump the information to a CSV file and sort the information.

```
xcp scan -match "type == d" -depth 3 -fmt "'{}, {}, {}, {}'.format(name, relpath, size)" NFS_Server_IP:/share > directory_report.csv
```

This is a custom report that uses the `-fmt` command. It scans all the directories and dumps the name of the directory, path, and size of directory into a CSV file. You can sort the size column from the spreadsheet application.

[Next: Data migration from 7-Mode to ONTAP.](#)

Data migration from 7-Mode to ONTAP

[Previous: Creating a CSV file from SMB/CIFS share.](#)

This section provides detailed steps for migrating data from NetApp Data ONTAP operating in 7-Mode to ONTAP.

Transitioning 7-Mode NFSv3 storage to ONTAP for NFS data

This section provides the step-by-step procedure in the following table for transitioning a source 7-Mode NFSv3 export to an ONTAP system.

NetApp assumes that the source 7-Mode NFSv3 volume is exported and mounted on the client system and that XCP is already installed on a Linux system.

1. Verify that the target ONTAP system is healthy.

```

CLUSTER::> cluster show
Node                Health  Eligibility
-----
CLUSTER-01          true    true
CLUSTER-02          true    true
2 entries were displayed.
CLUSTER::> node show
Node      Health Eligibility Uptime           Model      Owner      Location
-----
CLUSTER-01
           true   true       78 days 21:01 FAS8060           RTP
CLUSTER-02
           true   true       78 days 20:50 FAS8060           RTP
2 entries were displayed.
CLUSTER::> storage failover show
Node      Partner      Takeover
-----
CLUSTER-01 CLUSTER-02    true    Connected to CLUSTER-02
CLUSTER-02 CLUSTER-01    true    Connected to CLUSTER-01
2 entries were displayed.

```

2. Verify that at least one nonroot aggregate exists on the target system. The aggregate is normal.

```

CLUSTER::> storage aggregate show
Aggregate      Size Available Used% State   #Vols  Nodes      RAID
Status
-----
-----
aggr0          368.4GB   17.85GB   95% online      1 CLUSTER-01
raid_dp,

normal
aggr0_CLUSTER_02_0
              368.4GB   17.85GB   95% online      1 CLUSTER-02
raid_dp,

normal
source         1.23TB     1.10TB   11% online      6 CLUSTER-01
raid_dp,

normal
3 entries were displayed.

```

If there is no data aggregate, create a new one using the `storage aggr create` command.

3. Create a storage virtual machine (SVM) on the target cluster system.

```

CLUSTER::> vservers create -vservers dest -rootvolume dest_root -aggregate
poc -rootvolume-security-style mixed
[Job 647] Job succeeded:
Vservers creation completed
Verify the security style and language settings of the source

Verify that the SVM was successfully created.
CLUSTER::> vservers show -vservers dest

                Vservers: dest
                Vservers Type: data
                Vservers Subtype: default
                Vservers UUID: 91f6d786-0063-11e5-b114-
00a09853a969

                Root Volume: dest_root
                Aggregate: poc
                NIS Domain: -
                Root Volume Security Style: mixed
                LDAP Client: -
                Default Volume Language Code: C.UTF-8
                Snapshot Policy: default
                Comment:
                Quota Policy: default
                List of Aggregates Assigned: -
                Limit on Maximum Number of Volumes allowed: unlimited
                Vservers Admin State: running
                Vservers Operational State: running
                Vservers Operational State Stopped Reason: -
                Allowed Protocols: nfs, cifs, fcp, iscsi, ndmp
                Disallowed Protocols: -
                Is Vservers with Infinite Volume: false
                QoS Policy Group: -
                Config Lock: false
                IPspace Name: Default

```

4. Remove the FCP, iSCSI, NDMP, and CIFS protocols from the target SVM.

```

CLUSTER::> vservers remove-protocols -vservers dest -protocols
fcp,iscsi,ndmp,cifs

```

Verify that NFS is the allowed protocol for this SVM.

```

CLUSTER::> vserver show -vserver dest -fields allowed-protocols
vserver allowed-protocols
-----
dest      nfs

```

5. Create a new read-write data volume on the destination SVM. Verify that the security style, language settings, and capacity requirements match the source volume.

```

CLUSTER::> vol create -vserver dest -volume dest_nfs -aggregate poc
-size 150g -type RW -state online -security-style mixed
[Job 648] Job succeeded: Successful

```

6. Create a data LIF to serve NFS client requests.

```

CLUSTER::> network interface create -vserver dest -lif dest_lif -address
10.61.73.115 -netmask 255.255.255.0 -role data -data-protocol nfs -home
-node CLUSTER-01 -home-port e01

```

Verify that the LIF was successfully created.

```

CLUSTER::> network interface show -vserver dest

```

Current Is	Logical	Status	Network	Current	
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
dest	dest_lif	up/up	10.61.73.113/24	CLUSTER-01	e0i
true					

7. Create a static route with the SVM, if required.

```

CLUSTER::> network route create -vserver dest -destination 0.0.0.0/0
-gateway 192.168.100.111

```

Verify that the route was successfully created.

```
CLUSTER::> network route show -vserver source
```

Vserver	Destination	Gateway	Metric
dest	0.0.0.0/0	10.61.73.1	20

8. Mount the target NFS data volume in the SVM namespace.

```
CLUSTER::> volume mount -vserver dest -volume dest_nfs -junction-path /dest_nfs -active true
```

Verify that the volume is successfully mounted.

```
CLUSTER::> volume show -vserver dest -fields junction-path
```

vserver	volume	junction-path
dest	dest_nfs	/dest_nfs
dest	dest_root	/

2 entries were displayed.

You can also specify volume mount options (junction path) with the `volume create` command.

9. Start the NFS service on the target SVM.

```
CLUSTER::> vservers nfs start -vserver dest
```

Verify that the service is started and running.

```
CLUSTER::> vservers nfs status
```

The NFS server is running on Vserver "dest".

```
CLUSTER::> nfs show
```

Vserver: dest

General Access:	true
v3:	enabled
v4.0:	disabled
4.1:	disabled
UDP:	enabled
TCP:	enabled
Default Windows User:	-
Default Windows Group:	-

10. Verify that the default NFS export policy was applied to the target SVM.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
```

11. If required, create a new custom export policy for the target SVM.

```
CLUSTER::> vserver export-policy create -vserver dest -policyname
xcpexportpolicy
```

Verify that the new custom export policy was successfully created.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
dest             xcpexportpolicy
2 entries were displayed.
```

12. Modify the export policy rules to allow access to NFS clients.

```
CLUSTER::> export-policy rule modify -vserver dest -ruleindex 1
-policyname xcpexportpolicy -clientmatch 0.0.0.0/0 -rorule any -rwrule
any -anon 0
Verify the policy rules have modified
CLUSTER::> export-policy rule show -instance
Vserver: dest
Policy Name: xcpexportpolicy
Rule Index: 1
Access Protocol: nfs3
Client Match Hostname, IP Address, Netgroup, or Domain: 0.0.0.0/0
RO Access Rule: none
RW Access Rule: none
User ID To Which Anonymous Users Are Mapped: 65534
Superuser Security Types: none
Honor SetUID Bits in SETATTR: true
Allow Creation of Devices: true
```

13. Verify that the client is allowed access to the volume.

```
CLUSTER::> export-policy check-access -vserver dest -volume dest_nfs
-client-ip 10.61.82.215 -authentication-method none -protocol nfs3
-access-type read-write
```

Path	Policy	Policy Owner	Policy Owner Type	Rule Index
/	xcpexportpolicy	dest_root	volume	1
/dest_nfs	xcpexportpolicy	dest_nfs	volume	1

read-write
2 entries were displayed.

14. Connect to the Linux NFS server. Create a mount point for the NFS exported volume.

```
[root@localhost /]# cd /mnt
[root@localhost mnt]# mkdir dest
```

15. Mount the target NFSv3 exported volume at this mount point.

The NFSv3 volumes should be exported but not necessarily mounted by the NFS server. If they can be mounted, the XCP Linux host client mounts these volumes.

```
[root@localhost mnt]# mount -t nfs 10.61.73.115:/dest_nfs /mnt/dest
```

Verify that the mount point was successfully created.

```
[root@localhost /]# mount | grep nfs
10.61.73.115:/dest_nfs on /mnt/dest type nfs
(rw,relatime,vers=3,rsize=65536,wsiz=65536,namlen=255,hard,proto=tcp,timeo=600,retrans=2,sec=sys,mountaddr=10.61.82.215,mountvers=3,mountport=4046,mountproto=udp,local_lock=none,addr=10.61.73.115)
```

16. Create a test file on the NFS exported mount point to enable read-write access.

```
[root@localhost dest]# touch test.txt
Verify the file is created
[root@localhost dest]# ls -l
total 0
-rw-r--r-- 1 root bin 0 Jun  2 03:16 test.txt
```

After the read-write test is complete, delete the file from the target NFS mount point.

17. Connect to the Linux client system in which XCP is installed. Browse to the XCP install path.

```
[root@localhost ~]# cd /linux/
[root@localhost linux]#
```

18. Query the source 7-Mode NFSv3 exports by running the `xcp show` command on the XCP Linux client host system.

```
[root@localhost]# ./xcp show 10.61.82.215
== NFS Exports ==
Mounts  Errors  Server
      4      0 10.61.82.215
      Space   Files      Space   Files
      Free    Free      Used    Used Export
23.7 GiB  778,134   356 KiB     96 10.61.82.215:/vol/nfsvol1
17.5 GiB  622,463   1.46 GiB    117 10.61.82.215:/vol/nfsvol
328 GiB   10.8M   2.86 GiB   7,904 10.61.82.215:/vol/vol0/home

3.89 KiB in (5.70 KiB/s), 7.96 KiB out (11.7 KiB/s), 0s.
```

19. Scan the source NFSv3 exported paths and print the statistics of their file structure.

NetApp recommends putting the source NFSv3 exports in read-only mode during `xcp scan`, `copy`, and `sync` operations.

```
[root@localhost /]# ./xcp scan 10.61.82.215:/vol/nfsvol
nfsvol
nfsvol/n5000-uk9.5.2.1.N1.1.bin
nfsvol/821_q_image.tgz
nfsvol/822RC2_q_image.tgz
nfsvol/NX5010_12_node_RCF_v1.3.txt

MiB/s), 26s
Sending statistics...
44 scanned, 43 copied, 1.46 GiB in (47.6 MiB/s), 1.45 GiB out (47.6
MiB/s), 31s.
```

21. After the copy is finished, verify that the source and destination NFSv3 exports have identical data. Run the `xcp verify` command.

```
[root@localhost /]# ./xcp verify 10.61.82.215:/vol/nfsvol
10.61.73.115:/dest_nfs
44 scanned, 44 found, 28 compared, 27 same data, 2.41 GiB in (98.4
MiB/s), 6.25 MiB out (255 KiB/s), 26s
44 scanned, 44 found, 30 compared, 29 same data, 2.88 GiB in (96.4
MiB/s), 7.46 MiB out (249 KiB/s), 31s
44 scanned, 100% found (43 have data), 43 compared, 100% verified (data,
attrs, mods), 2.90 GiB in (92.6 MiB/s), 7.53 MiB out (240 KiB/s), 32s.
```

If `xcp verify` finds differences between the source and destination data, then the error no such file or directory is reported in the summary. To fix that issue, run the `xcp sync` command to copy the source changes to the destination.

22. Before and during the cutover, run `verify` again. If the source has new or updated data, then perform incremental updates. Run the `xcp sync` command.

```
For this operation, the previous copy index name or number is required.
[root@localhost /]# ./xcp sync -id 3
Index: {source: '10.61.82.215:/vol/nfsvol', target:
'10.61.73.115:/dest_nfs1'}

out (33.4 MiB/s), 54s.

```

After `resume` finishes copying files, run `verify` again so that the source and destination storage have identical data.

24. The NFSv3 client host needs to unmount the source NFSv3 exports provisioned from the 7-Mode storage and mounts the target NFSv3 exports from ONTAP. Cutover requires an outage.

Transitioning 7-Mode volume Snapshot copies to ONTAP

This section covers the procedure for transitioning a source 7-Mode volume NetApp Snapshot copy to ONTAP.

NetApp assumes that the source 7-Mode volume is exported and mounted on the client system and that XCP is already installed on a Linux system. A Snapshot copy is a point-in-time image of a volume that records incremental changes since the last Snapshot copy. Use the `-snap` option with a 7-Mode system as the source.

Warning: Keep the base Snapshot copy. Do not delete the base Snapshot copy after the baseline copy is complete. The base Snapshot copy is required for further sync operations.

1. Verify that the target ONTAP system is healthy.

```
CLUSTER::> cluster show
Node                               Health  Eligibility
-----
CLUSTER-01                        true    true
CLUSTER-02                        true    true
2 entries were displayed.
CLUSTER::> node show
Node      Health Eligibility Uptime           Model      Owner      Location
-----
CLUSTER-01
           true  true           78 days 21:01 FAS8060
CLUSTER-02
           true  true           78 days 20:50 FAS8060
2 entries were displayed.
CLUSTER::> storage failover show
Node      Partner      Takeover
-----
CLUSTER-01  CLUSTER-02  true    Connected to CLUSTER-02
CLUSTER-02  CLUSTER-01  true    Connected to CLUSTER-01
2 entries were displayed.
```

2. Verify that at least one nonroot aggregate exists on the target system. The aggregate is normal.

```

CLUSTER::> storage aggregate show
Aggregate      Size Available Used% State   #Vols  Nodes      RAID
Status
-----
-----
aggr0          368.4GB   17.85GB   95% online      1 CLUSTER-01
raid_dp,

normal
aggr0_CLUSTER_02_0
          368.4GB   17.85GB   95% online      1 CLUSTER-02
raid_dp,

normal
source         1.23TB     1.10TB   11% online      6 CLUSTER-01
raid_dp,

normal
3 entries were displayed.

```

If there is no data aggregate, create a new one using the `storage aggr create` command.

3. Create an SVM on the target cluster system.

```

CLUSTER::> vservers create -vservers dest -rootvolume dest_root -aggregate
poc -rootvolume-security-style mixed
[Job 647] Job succeeded:
Vservers creation completed
Verify the security style and language settings of the source

Verify that the SVM was successfully created.
CLUSTER::> vservers show -vservers dest

                Vservers: dest
                Vservers Type: data
                Vservers Subtype: default
                Vservers UUID: 91f6d786-0063-11e5-b114-
00a09853a969

                Root Volume: dest_root
                Aggregate: poc
                NIS Domain: -
                Root Volume Security Style: mixed
                LDAP Client: -
                Default Volume Language Code: C.UTF-8
                Snapshot Policy: default
                Comment:
                Quota Policy: default
                List of Aggregates Assigned: -
                Limit on Maximum Number of Volumes allowed: unlimited
                Vservers Admin State: running
                Vservers Operational State: running
                Vservers Operational State Stopped Reason: -
                Allowed Protocols: nfs, cifs, fcp, iscsi, ndmp
                Disallowed Protocols: -
                Is Vservers with Infinite Volume: false
                QoS Policy Group: -
                Config Lock: false
                IPspace Name: Default

```

4. Remove the FCP, iSCSI, NDMP, and CIFS protocols from the target SVM.

```

CLUSTER::> vservers remove-protocols -vservers dest -protocols
fcp,iscsi,ndmp,cifs
Verify that NFS is the allowed protocol for this SVM.
CLUSTER::> vservers show -vservers dest -fields allowed-protocols
vservers allowed-protocols
-----
dest      nfs

```

5. Create a new read-write data volume on the destination SVM. Verify that the security style, language settings, and capacity requirements match the source volume.

```
CLUSTER::> vol create -vserver dest -volume dest_nfs -aggregate poc
-size 150g -type RW -state online -security-style mixed
[Job 648] Job succeeded: Successful
```

6. Create a data LIF to serve NFS client requests.

```
CLUSTER::> network interface create -vserver dest -lif dest_lif -address
10.61.73.115 -netmask 255.255.255.0 -role data -data-protocol nfs -home
-node CLUSTER-01 -home-port e01
```

Verify that the LIF was successfully created.

```
CLUSTER::> network interface show -vserver dest
```

	Logical	Status	Network	Current	
Current Is					
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
dest	dest_lif	up/up	10.61.73.113/24	CLUSTER-01	e0i
true					

7. If required, create a static route with the SVM.

```
CLUSTER::> network route create -vserver dest -destination 0.0.0.0/0
-gateway 192.168.100.111
```

Verify that the route was successfully created.

```
CLUSTER::> network route show -vserver source
```

Vserver	Destination	Gateway	Metric
dest	0.0.0.0/0	10.61.73.1	20

8. Mount the target NFS data volume in the SVM namespace.

```
CLUSTER::> volume mount -vserver dest -volume dest_nfs -junction-path
/dest_nfs -active true
```

Verify that the volume was successfully mounted.

```
CLUSTER::> volume show -vserver dest -fields junction-path
vserver volume    junction-path
-----
dest    dest_nfs  /dest_nfs
dest    dest_root
        /
2 entries were displayed.
```

You can also specify the volume mount options (junction path) with the `volume create` command.

9. Start the NFS service on the target SVM.

```
CLUSTER::> vserver nfs start -vserver dest
```

Verify that the service is started and running.

```
CLUSTER::> vserver nfs status
The NFS server is running on Vserver "dest".
CLUSTER::> nfs show
Vserver: dest
    General Access:  true
                   v3:  enabled
                   v4.0: disabled
                   4.1: disabled
                   UDP:  enabled
                   TCP:  enabled
    Default Windows User:  -
    Default Windows Group:  -
```

10. Verify that the default NFS export policy is applied to the target SVM.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
```

11. If required, create a new custom export policy for the target SVM.

```
CLUSTER::> vserver export-policy create -vserver dest -policyname
xcpexportpolicy
```

Verify that the new custom export policy was successfully created.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
dest             xcpexportpolicy
2 entries were displayed.
```

12. Modify the export policy rules to allow access to NFS clients on the target system.

```
CLUSTER::> export-policy rule modify -vserver dest -ruleindex 1
-policyname xcpexportpolicy -clientmatch 0.0.0.0/0 -rorule any -rwrule
any -anon 0
Verify the policy rules have modified
CLUSTER::> export-policy rule show -instance
Vserver: dest
Policy Name: xcpexportpolicy
Rule Index: 1
Access Protocol: nfs3
Client Match Hostname, IP Address, Netgroup, or Domain: 0.0.0.0/0
RO Access Rule: none
RW Access Rule: none
User ID To Which Anonymous Users Are Mapped: 65534
Superuser Security Types: none
Honor SetUID Bits in SETATTR: true
Allow Creation of Devices: true
```

13. Verify that the client has access to the target volume.

```
CLUSTER::> export-policy check-access -vserver dest -volume dest_nfs
-client-ip 10.61.82.215 -authentication-method none -protocol nfs3
-access-type read-write
```

Path	Policy	Policy Owner	Policy Owner Type	Rule Index
Access				
/	xcpexportpolicy	dest_root	volume	1
read				
/dest_nfs	xcpexportpolicy	dest_nfs	volume	1
read-write				

2 entries were displayed.

14. Connect to the Linux NFS server. Create a mount point for the NFS exported volume.

```
[root@localhost /]# cd /mnt
[root@localhost mnt]# mkdir dest
```

15. Mount the target NFSv3 exported volume at this mount point.

The NFSv3 volumes should be exported but not necessarily mounted by the NFS server. If they can be mounted, the XCP Linux host client mounts these volumes.

```
[root@localhost mnt]# mount -t nfs 10.61.73.115:/dest_nfs /mnt/dest
```

Verify that the mount point was successfully created.

```
[root@localhost /]# mount | grep nfs
10.61.73.115:/dest_nfs on /mnt/dest type nfs
```

16. Create a test file on the NFS exported mount point to enable read-write access.

```
[root@localhost dest]# touch test.txt
Verify the file is created
[root@localhost dest]# ls -l
total 0
-rw-r--r-- 1 root bin 0 Jun  2 03:16 test.txt
```

After the read-write test is complete, delete the file from the target NFS mount point.

17. Connect to the Linux client system in which XCP is installed. Browse to the XCP install path.

```
[root@localhost ~]# cd /linux/
[root@localhost linux]#
```

18. Query the source 7-Mode NFSv3 exports by running the `xcp show` command on the XCP Linux client host system.

```
[root@localhost]# ./xcp show 10.61.82.215
== NFS Exports ==
Mounts  Errors  Server
      4      0 10.61.82.215
      Space  Files      Space  Files
      Free   Free      Used   Used Export
23.7 GiB 778,134 356 KiB    96 10.61.82.215:/vol/nfsvol1
17.5 GiB 622,463 1.46 GiB   117 10.61.82.215:/vol/nfsvol

3.89 KiB in (5.70 KiB/s), 7.96 KiB out (11.7 KiB/s), 0s.
```

19. Scan the source NFSv3 exported paths and print the statistics of their file structure.

NetApp recommends putting the source NFSv3 exports in read-only mode during `xcp scan`, `copy`, and `sync` operations. In `sync` operation, you must pass the `-snap` option with a corresponding value.

```
[root@localhost /]# ./xcp scan 10.61.82.215:/vol/nfsvol/.snapshot/snap1
nfsvol
nfsvol/n5000-uk9.5.2.1.N1.1.bin
nfsvol/821_q_image.tgz
nfsvol/822RC2_q_image.tgz
nfsvol/NX5010_12_node_RCF_v1.3.txt
nfsvol/n5000-uk9-kickstart.5.2.1.N1.1.bin
nfsvol/catalog
23 scanned, 7.79 KiB in (5.52 KiB/s), 1.51 KiB out (1.07 KiB/s), 1s.
[root@scspr1202780001 vol_acl4]# ./xcp sync -id 7msnap1 -snap
10.236.66.199:/vol/nfsvol/.snapshot/snap10
(show scan and sync)
```

20. Copy the source 7-Mode NFSv3 snapshot (base) to NFSv3 exports on the target ONTAP system.

```
[root@localhost /]# /xcp copy 10.61.82.215:/vol/nfsvol/.snapshot/snap1
10.61.73.115:/dest_nfs
44 scanned, 39 copied, 264 MiB in (51.9 MiB/s), 262 MiB out (51.5
MiB/s), 5s
44 scanned, 39 copied, 481 MiB in (43.3 MiB/s), 479 MiB out (43.4
MiB/s), 10s
44 scanned, 40 copied, 748 MiB in (51.2 MiB/s), 747 MiB out (51.3
MiB/s), 16s
44 scanned, 40 copied, 1.00 GiB in (55.9 MiB/s), 1.00 GiB out (55.9
MiB/s), 21s
44 scanned, 40 copied, 1.21 GiB in (42.8 MiB/s), 1.21 GiB out (42.8
MiB/s), 26s
Sending statistics...
44 scanned, 43 copied, 1.46 GiB in (47.6 MiB/s), 1.45 GiB out (47.6
MiB/s), 31s.
```

Keep this base snapshot for further sync operations.

21. After copy is complete, verify that the source and destination NFSv3 exports have identical data. Run the `xcp verify` command.

```
[root@localhost /]# ./xcp verify 10.61.82.215:/vol/nfsvol
10.61.73.115:/dest_nfs
44 scanned, 44 found, 28 compared, 27 same data, 2.41 GiB in (98.4
MiB/s), 6.25 MiB out (255 KiB/s), 26s
44 scanned, 44 found, 30 compared, 29 same data, 2.88 GiB in (96.4
MiB/s), 7.46 MiB out (249 KiB/s), 31s
44 scanned, 100% found (43 have data), 43 compared, 100% verified (data,
attrs, mods), 2.90 GiB in (92.6 MiB/s), 7.53 MiB out (240 KiB/s), 32s.
```

If `verify` finds differences between the source and destination data, then the error no such file or directory is reported in the summary. To fix that issue, run the `xcp sync` command to copy the source changes to the destination.

22. Before and during the cutover, run `verify` again. If the source has new or updated data, then perform incremental updates. If there are incremental changes, create a new Snapshot copy for these changes and pass that snapshot path with the `-snap` option for sync operations.

Run the `xcp sync` command with the `-snap` option and snapshot path.

```
[root@localhost /]# ./xcp sync -id 3
Index: {source: '10.61.82.215:/vol/nfsvol/.snapshot/snap1', target:
'10.61.73.115:/dest_nfs1'}
64 reviewed, 64 checked at source, 6 changes, 6 modifications, 51.7 KiB
in (62.5
KiB/s), 22.7 KiB out (27.5 KiB/s), 0s.
xcp: sync '3': Starting search pass for 1 modified directory...
xcp: sync '3': Found 6 indexed files in the 1 changed directory
xcp: sync '3': Rereading the 1 modified directory to find what's new...
xcp: sync '3': Deep scanning the 1 directory that changed...
11 scanned, 11 copied, 12.6 KiB in (6.19 KiB/s), 9.50 KiB out (4.66
KiB/s), 2s..
```

For this operation, the base snapshot is required.

23. To resume a previously interrupted copy operation, run the `xcp resume` command.

```
[root@scspr1202780001 534h_dest_vol]# ./xcp resume -id 3

```

24. The NFSv3 client host must unmount the source NFSv3 exports provisioned from the 7-Mode storage and mount the target NFSv3 exports from ONTAP. This cutover requires an outage.

Migrating ACLv4 from NetApp 7-Mode to a NetApp storage system

This section covers the step-by-step procedure for transitioning a source NFSv4 export to an ONTAP system.

NetApp assumes that the source NFSv4 volume is exported and mounted on the client system and that XCP is already installed on a Linux system. The source should be a NetApp 7-Mode system that support ACLs. ACL migration is supported from NetApp to NetApp only. To copy files with a special character in the name, make sure the source and destination support UTF-8 encoded language.

Prerequisites for migrating a source NFSv4 export to ONTAP

Before you migrate a source NFSv4 export to ONTAP, the following prerequisites must be met:

- The destination system must have NFSv4 configured.
- The NFSv4 source and target must be mounted on the XCP host. Select NFS v4.0 to match the source and target storage and verify that the ACLs are enabled on the source and target system.
- XCP requires the source/target path to be mounted on the XCP host for ACL processing. In the following example, vol1 (10.63.5.56:/vol1) is mounted on the /mnt/vol1 path:

```
[root@localhost ~]# df -h
Filesystem                                Size  Used
Avail Use% Mounted on
10.63.5.56:/vol1                          973M  4.2M
969M   1% /mnt/vol1
[root@localhost ~]# ./xcp scan -l -acl4 10.63.5.56:/vol1/
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to XXX [NetApp Inc] until
Sun Mar 31 00:00:00 2029
drwxr-xr-x --- root root 4KiB 4KiB 23h42m vol1
rw-r--r-- --- root root    4    0 23h42m vol1/DIR1/FILE
drwxr-xr-x --- root root 4KiB 4KiB 23h42m vol1/DIR1/DIR11
drwxr-xr-x --- root root 4KiB 4KiB 23h42m vol1/DIR1
rw-r--r-- --- root root    4    0 23h42m vol1/DIR1/DIR11/FILE
drwxr-xr-x --- root root 4KiB 4KiB 23h42m vol1/DIR1/DIR11/DIR2
rw-r--r-- --- root root    4    0 23h42m vol1/DIR1/DIR11/DIR2/FILE
drwxr-xr-x --- root root 4KiB 4KiB 17m43s vol1/DIR1/DIR11/DIR2/DIR22
8 scanned, 8 getacls, 1 v3perm, 7 acls, 3.80 KiB in (3.86 KiB/s), 1.21 KiB
out (1.23 KiB/s), 0s.
```

Subdirectories options

The two options to work with subdirectories are as follows:

- For XCP to work on a subdirectory (/vol1/DIR1/DIR11), mount the complete path (10.63.5.56:/vol1/DIR1/DIR11) on the XCP host.

If the complete path is not mounted, XCP reports the following error:

```
[root@localhost ~]# ./xcp scan -l -acl4 10.63.5.56:/vol1/DIR1/DIR11
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to XXX [NetApp Inc] until
Sun Mar 31 00:00:00 2029
xcp: ERROR: For xcp to process ACLs, please mount
10.63.5.56:/vol1/DIR1/DIR11 using the OS nfs4 client.
```

- Use the subdirectory syntax (mount: subdirectory/qtree/.snapshot), as shown in the example below:

```
[root@localhost ~]# ./xcp scan -l -acl4 10.63.5.56:/vol1:/DIR1/DIR11
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to XXX [NetApp Inc] until
Sun Mar 31 00:00:00 2029
drwxr-xr-x --- root root 4KiB 4KiB 23h51m DIR11
rw-r--r-- --- root root 4 0 23h51m DIR11/DIR2/FILE
drwxr-xr-x --- root root 4KiB 4KiB 26m9s DIR11/DIR2/DIR22
rw-r--r-- --- root root 4 0 23h51m DIR11/FILE
drwxr-xr-x --- root root 4KiB 4KiB 23h51m DIR11/DIR2
5 scanned, 5 getacls, 5 acls, 2.04 KiB in (3.22 KiB/s), 540 out (850/s),
0s.
```

Complete the following steps to migrate ACLv4 from NetApp 7-Mode to a NetApp storage system.

1. Verify that the target ONTAP system is healthy.

```
CLUSTER::> cluster show
Node                      Health  Eligibility
-----
CLUSTER-01                true   true
CLUSTER-02                true   true
2 entries were displayed.
CLUSTER::> node show
Node      Health Eligibility Uptime           Model      Owner      Location
-----
CLUSTER-01
      true  true           78 days 21:01 FAS8060      RTP
CLUSTER-02
      true  true           78 days 20:50 FAS8060      RTP
2 entries were displayed.
CLUSTER::> storage failover show
Node      Partner      Takeover
Possible State Description
-----
CLUSTER-01  CLUSTER-02  true   Connected to CLUSTER-02
CLUSTER-02  CLUSTER-01  true   Connected to CLUSTER-01
2 entries were displayed.
```

2. Verify that at least one nonroot aggregate exists on the target system. The aggregate is normal.

```

CLUSTER::> storage aggregate show
Aggregate      Size Available Used% State  #Vols  Nodes      RAID
Status
-----
-----
aggr0          368.4GB   17.85GB   95% online    1 CLUSTER-01
raid_dp,

normal
aggr0_CLUSTER_02_0
              368.4GB   17.85GB   95% online    1 CLUSTER-02
raid_dp,

normal
source         1.23TB    1.10TB   11% online    6 CLUSTER-01
raid_dp,

normal
3 entries were displayed.

```

If there is no data aggregate, create a new one using the `storage aggr create` command.

3. Create an SVM on the target cluster system.

```

CLUSTER::> vservers create -vservers dest -rootvolume dest_root -aggregate
poc -rootvolume-security-style mixed
[Job 647] Job succeeded:
Vserver creation completed
Verify the security style and language settings of the source

```

Verify that the SVM was successfully created.

```

CLUSTER::> vservers show -vservers dest

Vserver: dest
Vserver Type: data
Vserver Subtype: default
Vserver UUID: 91f6d786-0063-11e5-b114-
00a09853a969

Root Volume: dest_root
Aggregate: poc
NIS Domain: -
Root Volume Security Style: mixed
LDAP Client: -
Default Volume Language Code: C.UTF-8
Snapshot Policy: default
Comment:
Quota Policy: default
List of Aggregates Assigned: -
Limit on Maximum Number of Volumes allowed: unlimited
Vserver Admin State: running
Vserver Operational State: running
Vserver Operational State Stopped Reason: -
Allowed Protocols: nfs, cifs, fcp, iscsi, ndmp
Disallowed Protocols: -
Is Vserver with Infinite Volume: false
QoS Policy Group: -
Config Lock: false
IPspace Name: Default

```

4. Remove the FCP, iSCSI, NDMP, and CIFS protocols from the target SVM.

```

CLUSTER::> vservers remove-protocols -vservers dest -protocols
fcp,iscsi,ndmp,cifs

```

Verify that NFS is the allowed protocol for this SVM.

```

CLUSTER::> vservers show -vservers dest -fields allowed-protocols
vservers allowed-protocols
-----
dest      nfs

```

5. Create a new read-write data volume on the destination SVM. Verify that the security style, language settings, and capacity requirements match the source volume.

```
CLUSTER::> vol create -vserver dest -volume dest_nfs -aggregate poc
-size 150g -type RW -state online -security-style mixed
[Job 648] Job succeeded: Successful
```

6. Create a data LIF to serve NFS client requests.

```
CLUSTER::> network interface create -vserver dest -lif dest_lif -address
10.61.73.115 -netmask 255.255.255.0 -role data -data-protocol nfs -home
-node CLUSTER-01 -home-port e01
```

Verify that the LIF was successfully created.

```
CLUSTER::> network interface show -vserver dest
```

Current Is	Logical	Status	Network	Current	
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
dest	dest_lif	up/up	10.61.73.113/24	CLUSTER-01	e0i
true					

7. If required, create a static route with the SVM.

```
CLUSTER::> network route create -vserver dest -destination 0.0.0.0/0
-gateway 192.168.100.111
```

Verify that the route was successfully created.

```
CLUSTER::> network route show -vserver source
```

Vserver	Destination	Gateway	Metric
dest	0.0.0.0/0	10.61.73.1	20

8. Mount the target NFS data volume in the SVM namespace.

```
CLUSTER::> volume mount -vserver dest -volume dest_nfs -junction-path
/dest_nfs -active true
```

Verify that the volume was successfully mounted.

```
CLUSTER::> volume show -vserver dest -fields junction-path
vserver volume    junction-path
-----
dest    dest_nfs  /dest_nfs
dest    dest_root
          /
2 entries were displayed.
```

You can also specify the volume mount options (junction path) with the `volume create` command.

9. Start the NFS service on the target SVM.

```
CLUSTER::> vserver nfs start -vserver dest
```

Verify that the service is started and running.

```
CLUSTER::> vserver nfs status
The NFS server is running on Vserver "dest".
CLUSTER::> nfs show
Vserver: dest
      General Access:  true
                   v3:  enabled
                   v4.0: enabled
                   4.1: disabled
                   UDP:  enabled
                   TCP:  enabled
      Default Windows User:  -
      Default Windows Group:  -
```

10. Check that the default NFS export policy is applied to the target SVM.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
```

11. If required, create a new custom export policy for the target SVM.

```
CLUSTER::> vserver export-policy create -vserver dest -policyname
xcpexportpolicy
```

Verify that the new custom export policy was successfully created.

```
CLUSTER::> vserver export-policy show -vserver dest
Vserver          Policy Name
-----
dest             default
dest             xcpexportpolicy
2 entries were displayed.
```

12. Modify the export policy rules to allow access to NFS clients.

```
CLUSTER::> export-policy rule modify -vserver dest -ruleindex 1
-policyname xcpexportpolicy -clientmatch 0.0.0.0/0 -rorule any -rwrule
any -anon 0
```

Verify that the policy rules have been modified.

```
CLUSTER::> export-policy rule show -instance
Vserver: dest
Policy Name: xcpexportpolicy
Rule Index: 1
Access Protocol: nfs3
Client Match Hostname, IP Address, Netgroup, or Domain: 0.0.0.0/0
RO Access Rule: none
RW Access Rule: none
User ID To Which Anonymous Users Are Mapped: 65534
Superuser Security Types: none
Honor SetUID Bits in SETATTR: true
Allow Creation of Devices: true
```

13. Verify that the client is allowed access to the volume.

```
CLUSTER::> export-policy check-access -vserver dest -volume dest_nfs
-client-ip 10.61.82.215 -authentication-method none -protocol nfs3
-access-type read-write
```

Path	Policy	Policy Owner	Policy Owner Type	Rule Index
Access				
/	xcpexportpolicy	dest_root	volume	1
read				
/dest_nfs	xcpexportpolicy	dest_nfs	volume	1
read-write				

2 entries were displayed.

14. Connect to the Linux NFS server. Create a mount point for the NFS exported volume.

```
[root@localhost /]# cd /mnt
[root@localhost mnt]# mkdir dest
```

15. Mount the target NFSv4 exported volume at this mount point.

The NFSv4 volumes should be exported but not necessarily mounted by the NFS server. If they can be mounted, the XCP Linux host client mounts these volumes.

```
[root@localhost mnt]# mount -t nfs4 10.63.5.56:/vol1 /mnt/vol1
```

Verify that the mount point was successfully created.

```
[root@localhost mnt]# mount | grep nfs
10.63.5.56:/vol1 on /mnt/vol1 type nfs4
(rw,relatime,vers=4.0,rsz=65536,wsz=65536,namlen=255,hard,proto=tcp,
timeo=600,
retrans=2,sec=sys,clientaddr=10.234.152.84,local_lock=none,addr=10.63.5.
56)
```

16. Create a test file on the NFS exported mount point to enable read-write access.

```
[root@localhost dest]# touch test.txt
```

Verify the file is created.

```
[root@localhost dest]# ls -l
total 0
-rw-r--r-- 1 root bin 0 Jun  2 03:16 test.txt
```

After the read-write test is complete, delete the file from the target NFS mount point.

17. Connect to the Linux client system in which XCP is installed. Browse to the XCP install path.

```
[root@localhost ~]# cd /linux/
[root@localhost linux]#
```

18. Query the source NFSv4 exports by running the `xcp show` command on the XCP Linux client host system.

```

root@localhost]# ./xcp show 10.63.5.56
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
getting pmap dump from 10.63.5.56 port 111...
getting export list from 10.63.5.56...
sending 6 mounts and 24 nfs requests to 10.63.5.56...

drwxr-xr-x --- root root 4KiB 4KiB 9d4h 10.63.5.56:/vol4
6.09 KiB in (9.19 KiB/s), 12.2 KiB out (18.3 KiB/s), 0s.

```

19. Scan the source NFSv4 exported paths and print the statistics of their file structure.

NetApp recommends putting the source NFSv4 exports in read-only mode during `xcp scan`, `copy`, and `sync` operations.

```

[root@localhost]# ./xcp scan -acl4 10.63.5.56:/vol1
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
vol1
vol1/test/f1
vol1/test
3 scanned, 3 getacls, 3 v3perms, 1.59 KiB in (1.72 KiB/s), 696 out
(753/s), 0s.

```

20. Copy source NFSv4 exports to NFSv4 exports on the target ONTAP system.

```
[root@localhost]# ./xcp copy -acl4 -newid id1 10.63.5.56:/vol1
10.63.5.56:/vol2
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
3 scanned, 2 copied, 3 indexed, 3 getacls, 3 v3perms, 1 setacl, 14.7 KiB
in (11.7 KiB/s), 61 KiB out (48.4 KiB/s), 1s..
```

21. After copy is complete, verify that the source and destination NFSv4 exports have identical data. Run the `xcp verify` command.

```
[root@localhost]# ./xcp verify -acl4 -noid 10.63.5.56:/vol1
10.63.5.56:/vol2
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
3 scanned, 100% found (0 have data), 100% verified (data, attrs, mods,
acls), 6 getacls, 6 v3perms, 2.90 KiB in (4.16 KiB/s), 2.94 KiB out
(4.22 KiB/s), 0s.
```

If `verify` finds differences between the source and destination data, then the error no such file or directory is reported in the summary. To fix that issue, run the `xcp sync` command to copy the source changes to the destination.

22. Before and during the cutover, run `verify` again. If the source has new or updated data, then perform incremental updates. Run the `xcp sync` command.

```
[root@ root@localhost]# ./xcp sync -id id1
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
xcp: Index: {source: 10.63.5.56:/vol1, target: 10.63.5.56:/vol2}
3 reviewed, 3 checked at source, no changes, 3 reindexed, 25.6 KiB in
(32.3 KiB/s), 23.3 KiB out (29.5 KiB/s), 0s.
```

For this operation, the previous copy index name or number is required.

23. To resume a previously interrupted copy operation, run the `xcp resume` command.

```
[root@localhost]# ./xcp resume -id id1
XCP <version>; (c) 2020 NetApp, Inc.; Licensed to xxx [NetApp Inc] until
Mon Dec 31 00:00:00 2029
xcp: Index: {source: 10.63.5.56:/vol3, target: 10.63.5.56:/vol4}
xcp: resume 'id1': Reviewing the incomplete index...
xcp: diff 'id1': Found 0 completed directories and 8 in progress
39,899 reviewed, 1.64 MiB in (1.03 MiB/s), 14.6 KiB out (9.23 KiB/s),
1s.
xcp: resume 'id1': Starting second pass for the in-progress
directories...
xcp: resume 'id1': Resuming the in-progress directories...
xcp: resume 'id1': Resumed command: copy {-acl4: True}
xcp: resume 'id1': Current options: {-id: 'id1'}
xcp: resume 'id1': Merged options: {-acl4: True, -id: 'id1'}
xcp: resume 'id1': Values marked with a * include operations before
resume
  86,404 scanned, 39,912 copied, 39,899 indexed, 13.0 MiB in (2.60
MiB/s), 78.4 KiB out (15.6 KiB/s), 5s 86,404 scanned, 39,912 copied,
39,899 indexed, 13.0 MiB in (0/s), 78.4 KiB out (0/s), 10s
1.00M scanned, 100% found (1M have data), 1M compared, 100% verified
(data, attrs, mods, acls), 2.00M getacls, 202 v3perms, 1.00M same acls,
2.56 GiB in (2.76 MiB/s), 485 MiB out (524 KiB/s), 15m48s.
```

After `resume` finishes copying files, run `verify` again so that the source and destination storage have identical data.

Transitioning 7-Mode SMB storage to ONTAP for CIFS data

This section covers the step-by-step procedure for transitioning a source 7-Mode SMB share to an ONTAP system.

NetApp assumes that the 7-Mode and ONTAP systems are SMB licensed. The destination SVM is created, the source and destination SMB shares are exported, and XCP is installed and licensed.

1. Scan the SMB shares for the files and directories.

```

C:\xcp>xcp scan -stats \\10.61.77.189\performance_SMB_home_dirs
XCP SMB 1.6; (c) 2020 NetApp, Inc.; Licensed to xxxx xxxx[NetApp Inc]
until Mon Dec 31 00:00:00 2029

[Next: CIFS data migration with ACLs From a source storage box to ONTAP.](#)

CIFS data migration with ACLs from a source storage box to ONTAP

[Previous: Data migration from 7-Mode to ONTAP.](#)

This section covers the step-by-step procedure for migrating CIFS data with security information from a source to a target ONTAP system.

1. Verify that the target ONTAP system is healthy.

```

C1_sti96-vsim-ucs540m_cluster::> cluster show
Node                               Health  Eligibility
-----
sti96-vsim-ucs540m      true    true
sti96-vsim-ucs540n      true    true
2 entries were displayed.
C1_sti96-vsim-ucs540m_cluster::> node show
Node      Health  Eligibility  Uptime           Model      Owner      Location
-----
sti96-vsim-ucs540m

5 entries were displayed.
```

If there is no data aggregate, create a new one using the `storage aggr create` command.

3. Create an SVM on the target cluster system.

```
cluster::*> vsriver create -vsriver vs1 -rootvolume root_vs1 -aggregate
sti96_vsim_ucs540o_aggr1 -rootvolume-security-style mixed
```

Verify that the SVM was successfully created.

```
C2_sti96_vsim_ucs540o_cluster::*> vsriver show -vsriver vs1
      Vserver: vs1
      Vserver Type: data
      Vserver Subtype: default
      Vserver UUID: f8bc54be-d91b-11e9-b99c-
005056a7e57e
      Root Volume: root_vs1
      Aggregate: sti96_vsim_ucs540o_aggr1
      NIS Domain: NSQA-RTP-NIS1
      Root Volume Security Style: mixed
      LDAP Client: esisconfig
      Default Volume Language Code: C.UTF-8
      Snapshot Policy: default
      Data Services: data-nfs, data-cifs,
                    data-flexcache, data-iscsi
      Comment: vs1
      Quota Policy: default
      List of Aggregates Assigned: -
      Limit on Maximum Number of Volumes allowed: unlimited
      Vserver Admin State: running
      Vserver Operational State: running
      Vserver Operational State Stopped Reason: -
      Allowed Protocols: nfs, cifs, fcp, iscsi, ndmp
      Disallowed Protocols: -
      Is Vserver with Infinite Volume: false
      QoS Policy Group: -
      Caching Policy Name: -
      Config Lock: false
      Volume Delete Retention Period: 0
      IPspace Name: Default
      Foreground Process: -
      Is Msid Preserved for DR: false
      Force start required to start Destination in muliple IDP fan-out case:
false
      Logical Space Reporting: false
      Logical Space Enforcement: false
```

4. Create a new read-write data volume on the destination SVM. Verify that the security style, language settings, and capacity requirements match the source volume.

```
CLUSTER CLUSTER::> vol create -vserver vs1 -volume dest_vol -aggregate
aggr_001 -size 150g type RW -state online -security-style ntfs
```

5. Create a data LIF to serve SMB client requests.

```
CLUSTER::> network interface create -vserver vs1 -lif sti96-vsim-
ucs540o_data1 -address 10.237.165.87 -netmask 255.255.240.0 -role data
-data-protocol nfs,cifs -home-node sti96-vsim-ucs540o -home-port e0d
```

Verify that the LIF was successfully created.

```
cluster::*> network interface show -vserver vs1
```

Current Is	Logical	Status	Network	Current
Vserver	Interface	Admin/Oper	Address/Mask	Node
Home				Port
vs1	sti96-vsim-ucs540o_data1	up/up	10.237.165.87/20	sti96-vsim-ucs540o e0d
true				

6. If required, create a static route with the SVM.

```
Network route create -vserver dest -destination 0.0.0.0/0 -gateway
10.237.160.1
```

Verify that the route was successfully created.

```
cluster::*> network route show -vserver vs1
```

Vserver	Destination	Gateway	Metric
vs1	0.0.0.0/0	10.237.160.1	20
	::/0	fd20:8b1e:b255:9155::1	20

2 entries were displayed.

7. Mount the target data volume in the SVM namespace.

```
CLUSTER::> volume mount -vserver vs1 -volume dest_vol -junction-path
/dest_vol -active true
```

Verify that the volume is successfully mounted.

```
cluster::*> volume show -vserver vs1 -fields junction-path
vserver volume    junction-path
-----
vs1      dest_vol  /dest_vol
vs1      root_vs1  /
2 entries were displayed.
Note: You can also specify the volume mount options (junction path) with
the volume create command.
```

8. Start the CIFS service on the target SVM.

```
cluster::*> vserver cifs start -vserver vs1
Warning: The admin status of the CIFS server for Vserver "vs1" is
already "up".
```

Verify that the service is started and running.

```
cluster::*>
Verify the service is started and running
C2_sti96-vs1m-ucs540o_cluster::*> cifs show
```

Vserver	Server Name	Status Admin	Domain/Workgroup Name	Authentication Style
vs1	D60AB15C2AFC4D6	up	CTL	domain

9. Verify that the default export policy is applied to the target SVM.

```
CLUSTER::> vserver export-policy show -vserver dest
```

Vserver	Policy Name
dest	default

If required, create a new custom export policy for the target SVM.

```
CLUSTER::> vserver export-policy create -vserver vs1 -policyname  
xcpexport
```

10. Modify the export policy rules to allow access to CIFS clients.

```
CLUSTER::> export-policy rule modify -vserver dest -ruleindex 1  
-policyname xcpexportpolicy -clientmatch 0.0.0.0/0 -rorule any -rwrule  
any -anon 0
```

Verify that the policy rules are modified.

```

cluster::*> export-policy rule show -instance
                Vserver: vs1
                Policy Name: default
                Rule Index: 1
                Access Protocol: any
List of Client Match Hostnames, IP Addresses, Netgroups, or Domains:
0.0.0.0/0
                RO Access Rule: any
                RW Access Rule: any

                Superuser Security Types: any
                Honor SetUID Bits in SETATTR: true
                Allow Creation of Devices: true
                NTFS Unix Security Options: fail
Vserver NTFS Unix Security Options: use_export_policy
                Change Ownership Mode: restricted
Vserver Change Ownership Mode: use_export_policy
                Policy ID: 12884901889
                Vserver: vs1
                Policy Name: default
                Rule Index: 2
                Access Protocol: any
List of Client Match Hostnames, IP Addresses, Netgroups, or Domains:
0:0:0:0:0:0:0:0/0
                RO Access Rule: any
                RW Access Rule: any
User ID To Which Anonymous Users Are Mapped: 65534
                Superuser Security Types: none
                Honor SetUID Bits in SETATTR: true
                Allow Creation of Devices: true
                NTFS Unix Security Options: fail
Vserver NTFS Unix Security Options: use_export_policy
                Change Ownership Mode: restricted
Vserver Change Ownership Mode: use_export_policy
                Policy ID: 12884901889
2 entries were displayed.

```

11. Verify that the client is allowed access to the volume.

```
cluster::*> export-policy check-access -vserver vs1 -volume dest_vol
-client-ip 10.234.17.81 -authentication-method none -protocol cifs
-access-type read-write
```

Path	Policy	Policy Owner	Policy Owner Type	Rule Index
Access				
-----	-----	-----	-----	-----
/	default	root_vs1	volume	1
read				
/dest_vol	default	dest_vol	volume	1
read-write				

2 entries were displayed.

12. Connect to the Windows client system where XCP is installed. Browse to the XCP install path.

```
C:\WRSHDNT>dir c:\netapp\xcp
dir c:\netapp\xcp
Volume in drive C has no label.
Volume Serial Number is 5C04-C0C7
Directory of c:\netapp\xcp
09/18/2019  09:30 AM    <DIR>          .
09/18/2019  09:30 AM    <DIR>          ..
06/25/2019  06:27 AM                304 license
09/18/2019  09:30 AM    <DIR>          Logs
09/29/2019  08:45 PM      12,143,105 xcp.exe
                2 File(s)      12,143,409 bytes
                3 Dir(s)  29,219,549,184 bytes free
```

13. Query the source node SMB exports by running the `xcp show` command on the XCP Windows client host system.

```

C:\WRSHDNT>c:\netapp\xcp\xcp show \\10.237.165.71
c:\netapp\xcp\xcp show \\10.237.165.71

14. Run the help command for copy.

```

C:\WRSHDNT>c:\netapp\xcp\xcp help copy
c:\netapp\xcp\xcp help copy
XCP SMB 1.6; (c) 2020 NetApp, Inc.; Licensed to XXX [NetApp Inc] until
Mon Dec 31 00:00:00 2029
usage: xcp copy [-h] [-v] [-parallel <n>] [-match <filter>] [-preserve-
atime]
                [-acl] [-fallback-user FALLBACK_USER]
                [-fallback-group FALLBACK_GROUP] [-root]
                source target
positional arguments:
  source
  target
optional arguments:
  -h, --help            show this help message and exit
  -v                    increase debug verbosity
  -parallel <n>         number of concurrent processes (default: <cpu-
count>)
  -match <filter>       only process files and directories that match
the
                        filter (see `xcp help -match` for details)
  -preserve-atime       restore last accessed date on source
  -acl                  copy security information
  -fallback-user FALLBACK_USER
                        the name of the user on the target machine to
receive
                        the permissions of local (non-domain) source
machine
                        users (eg. domain\administrator)
  -fallback-group FALLBACK_GROUP
                        the name of the group on the target machine to
receive
                        the permissions of local (non-domain) source
machine
                        groups (eg. domain\administrators)
  -root                 copy acl for root directorytxt

```

15. On the target ONTAP system, get the list of local user and local group names that you need to provide as values for the fallback-user and fallback-group arguments path.

```

cluster::*> local-user show
(vserver cifs users-and-groups local-user show)
Vserver      User Name      Full Name
Description
-----
vs1          D60AB15C2AFC4D6\Administrator
                                           Built-in
administrator account
C2_sti96-vsim-ucs540o_cluster::*> local-group show
(vserver cifs users-and-groups local-group show)
Vserver      Group Name      Description

vs1          BUILTIN\Power Users      Restricted
administrative privileges
vs1          BUILTIN\Users      All users
5 entries were displayed

```

16. To migrate the CIFS data with ACLs from the source to target, run the `xcp copy` command with the `-acl` and `-fallback-user/group` options.

For the `fallback-user/group` options, specify any user or group that can be found in Active Directory or local user/group to target system.

```

C:\WRSHDNT>c:\netapp\xcp\xcp copy -acl -fallback-user
