# SnapCenter for databases

## TR-4964: Oracle Database backup, restore and clone with SnapCenter Services

Allen Cao, Niyaz Mohamed, NetApp

### Purpose

SnapCenter Services is the SaaS version of the classic SnapCenter database management UI tool that is available through the NetApp BlueXP cloud management console. It is an integral part of the NetApp cloud-backup, data-protection offering for databases such as Oracle and HANA running on NetApp cloud storage. This SaaS-based service simplifies traditional SnapCenter standalone server deployment that generally requires a Windows server operating in a Windows domain environment.

In this documentation, we demonstrate how you can set up SnapCenter Services to backup, restore, and clone Oracle databases deployed to Amazon FSx for ONTAP storage and EC2 compute instances. Although it is much easier to set up and use, SnapCenter Services deliver key functionalities that are available in the legacy SnapCenter UI tool.

This solution addresses the following use cases:

- Database backup with snapshots for Oracle databases hosted in Amazon FSx for ONTAP
- Oracle database recovery in the case of a failure
- Fast and storage-efficient cloning of primary databases for a dev/test environment or other use cases

### Audience

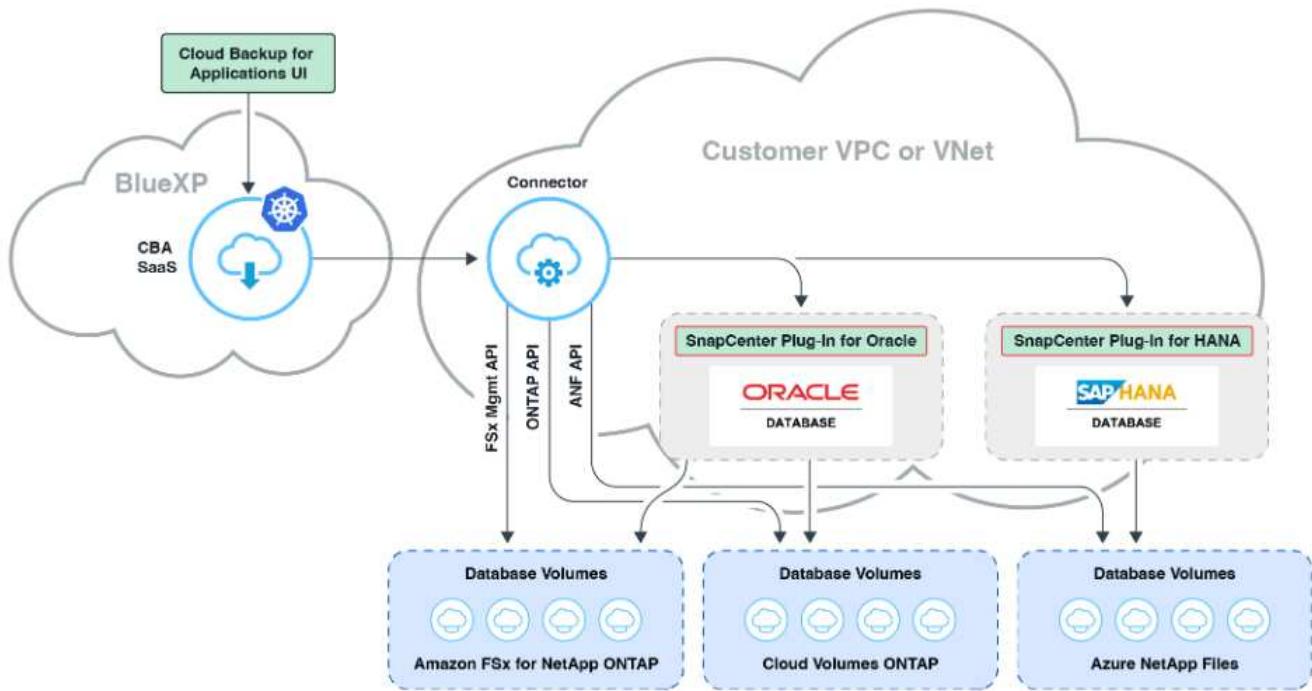

This solution is intended for the following audiences:

- The DBA who manages Oracle databases running on Amazon FSx for ONTAP storage
- The solution architect who is interested in testing Oracle database backup, restore, and clone in the public AWS cloud
- The storage administrator who supports and manages the Amazon FSx for ONTAP storage
- The application owner who owns applications that are deployed to Amazon FSx for ONTAP storage

### Solution test and validation environment

The testing and validation of this solution was performed in an AWS FSx and EC2 environment that might not match the final deployment environment. For more information, see the section [\[Key Factors for Deployment Consideration\]](#).

### Architecture

This image provides a detailed picture of Cloud Backup for Application within the BlueXP console, including the UI, the connector, and the resources it manages.

## Hardware and software components

Hardware		
FSx ONTAP storage	Current version offered by AWS	One FSx HA cluster in the same VPC and availability zone
EC2 instance for compute	t2.xlarge/4vCPU/16G	Two EC2 T2 xlarge EC2 instances, one as primary DB server and the other as clone DB server
Software		
RedHat Linux	RHEL-8.6.0_HVM-20220503-x86_64-2-Hourly2-GP2	Deployed RedHat subscription for testing
Oracle Grid Infrastructure	Version 19.18	Applied RU patch p34762026_190000_Linux-x86-64.zip
Oracle Database	Version 19.18	Applied RU patch p34765931_190000_Linux-x86-64.zip
Oracle OPatch	Version 12.2.0.1.36	Latest patch p6880880_190000_Linux-x86-64.zip
SnapCenter Service	Version	v2.3.1.2324

## Key factors for deployment consideration

- **Connector to be deployed in the same VPC as database and FSx.** When possible, the connector should be deployed in the same AWS VPC, which enables connectivity to the FSx storage and the EC2 compute instance.

- **An AWS IAM policy created for SnapCenter connector.** The policy in JSON format is available in the detailed SnapCenter service documentation. When you launch connector deployment with the BlueXP console, you are prompted to set up the prerequisites. The policy should be assigned to the AWS user account that owns the connector.
- **The AWS account access key and the SSH key pair created in the AWS account.** The SSH key pair is assigned to the ec2-user for logging into the connector host and then deploying a database plug-in to the EC2 DB server host. The access key grants permission for provisioning the required connector.
- **A credential added to the BlueXP console setting.** To add Amazon FSx for ONTAP to the BlueXP working environment, a credential that grants permissions to access Amazon FSx for ONTAP from the BlueXP console is set up in the BlueXP console setting.
- **SnapCenter plug-in deployed to the EC2 database instance host.** SnapCenter services make API calls that are executed by the SnapCenter plug-in on the EC2 database instance host. You must deploy it before setting up the services.

## Solution deployment

There is extensive NetApp documentation with a broader scope to help you protect your cloud-native application data. The goal of this documentation is to provide step-by-step procedures that cover SnapCenter Service deployment with the BlueXP console to protect your Oracle database deployed to Amazon FSx for ONTAP and an EC2 compute instance. This document fills in certain details that might be missing from more general instructions.

To get started, complete the following steps:

- Read the general instructions [Protect your cloud native applications data](#) and the sections related to Oracle and Amazon FSx for ONTAP.
- Watch the following video walkthrough.
  - ▶ <https://docs.netapp.com/us-en/netapp-solutions/media/oracle-aws-fsx-part4c-bkup-restore->

[snapctrsvc\\_callout.mp4](#) (video)

## Prerequisites for SnapCenter service deployment

Deployment requires the following prerequisites.

1. A primary Oracle database server on an EC2 instance with an Oracle database fully deployed and running.
2. A Amazon FSx for ONTAP cluster deployed in AWS that is hosting the database above.
3. An optional database server on an EC2 instance that can be used for testing the cloning of an Oracle database to an alternative host for the purpose of supporting a dev/test workload or any use cases that requires a full data set of production Oracle database.
4. If you need help to meet the above prerequisites for Oracle database deployment on Amazon FSx for ONTAP and EC2 compute instance, see [Oracle Database Deployment and Protection in AWS FSx/EC2 with iSCSI/ASM](#).

## Onboarding to BlueXP preparation

1. Use the link [NetApp BlueXP](#) to sign up for BlueXP console access.
2. To set up BlueXP to manage AWS cloud resources such as Amazon FSx for ONTAP, you should already have an AWS account set up. You can then log into your AWS account to create an IAM policy for granting SnapCenter service access to an AWS account to use for connector deployment.

The screenshot shows the AWS Identity and Access Management (IAM) console. The left sidebar is collapsed, and the main area displays the 'Summary' tab for a policy named 'snapcenter'. The policy ARN is listed as 'arn:aws:iam::541696183547:policy/snapcenter'. The description is 'Policy to grant snapcenter service permission to create connector in AWS.' Below the ARN and description, there are tabs for 'Permissions', 'Policy usage', 'Tags', 'Policy versions', and 'Access Advisor'. The 'Permissions' tab is selected, showing a 'Policy summary' and a 'JSON' button. The JSON code is displayed in a monospaced font:

```

1  {
2   "Version": "2012-10-17",
3   "Statement": [
4     {
5       "Effect": "Allow",
6       "Action": [
7         "iam:CreateRole",
8         "iam:DeleteRole",
9         "iam:PutRolePolicy",
10        "iam:CreateInstanceProfile",
11        "iam:DeleteRolePolicy",
12        "iam:AddRoleToInstanceProfile",
13        "iam:RemoveRoleFromInstanceProfile",
14        "iam:DeleteInstanceProfile",
15        "iam:PassRole",
16        "iam>ListRoles",
17        "ec2:DescribeInstanceStatus",
18        "ec2:RunInstances",
19        "ec2:ModifyInstanceAttribute",
20        "ec2>CreateSecurityGroup",
21        "ec2>DeleteSecurityGroup",
22        "ec2:DescribeSecurityGroups",
23        "ec2:RevokeSecurityGroupEgress",
24        "ec2:AuthorizeSecurityGroupEgress",
25        "ec2:AuthorizeSecurityGroupIngress",
26        "ec2:RevokeSecurityGroupIngress",
27        "ec2>CreateNetworkInterface",
28        "ec2:DescribeNetworkInterface"
29      ]
30    }
31  ]
32}

```

The policy should be configured with a JSON string that is available when connector provisioning is launched and you are prompted as a reminder that an IAM policy has been created and granted to an AWS account that is used for connector deployment.

3. You also need the AWS VPC, a key and secrets for your AWS account, an SSH key for EC2 access, a security group, and so on ready for connector provisioning.

## Deploy a connector for SnapCenter services

1. Log into the BlueXP console. For a shared account, it is a best practice to create an individual workspace by clicking **Account** > **Manage Account** > **Workspace** to add a new workspace.

Manage Account: Automation-team

Overview Members Workspaces BlueXP Connector X

Manage the BlueXP connector Workspaces

+ Add New Workspace

Database	 
Database-2	 
sufians-k8	 
Workspace-1	 

2. Click **Add a Connector** to launch the connector provisioning workflow.

3. Choose your cloud provider (in this case, **Amazon Web Services**).

Add Connector X

**Provider**

Choose the cloud provider where you want to run the Connector:

Microsoft Azure

Amazon Web Services

Google Cloud Platform

Continue Back

4. Skip the **Permission**, **Authentication**, and **Networking** steps if you already have them set up in your AWS account. If not, you must configure these before proceeding. From here, you could also retrieve the permissions for the AWS policy that is referenced in the previous section "[Onboarding to BlueXP preparation](#)."

## Add Connector - AWS

**Deploying a Connector**

The Connector is a crucial component for the day-to-day use of Cloud Manager. It's used to connect Cloud Manager's services to your hybrid-cloud environments. The Connector can then manage the resources and processes within your public cloud environment.

Before you begin the deployment process, ensure that you have completed the required preparations. This guide will enable you to focus on the minimum requirements for Connector installation.

<b>Permissions</b> Set up an IAM role with the required permissions	<b>Authentication</b> Choose between two AWS authentication methods: AWS keys or assuming an IAM role	<b>Networking</b> Obtain details about the VPC and subnet in which the Connector will reside
--	--	---

[Skip to Deployment](#)

[Previous](#) [Continue](#) 

5. Enter your AWS account authentication access key and secret key.

## Add Connector - AWS

More Information  X

1 AWS Credentials    2 Details    3 Network    4 Security Group    5 Review

### AWS Authentication

Region: us-east-1 | US East (N. Virginia)

Select the Authentication Method:  Assume Role  AWS Keys

AWS Access Key: AKIA6JRXA6ZGVFVSHMO3

AWS Secret Key: [REDACTED]

Want to launch an instance without AWS Credentials? ▾

[Previous](#) [Next](#) 

6. Name the connector instance and select **Create Role** under **Details**.

The screenshot shows the 'Add Connector - AWS' interface. At the top, there are five tabs: 'AWS Credentials' (selected), 'Details' (highlighted in blue), 'Network', 'Security Group', and 'Review'. Below the tabs, the 'Details' section is titled 'Details'. It contains fields for 'Connector Instance Name' (set to 'SnapCenterSvs'), 'Connector Role' (radio button selected for 'Create Role'), 'Role Name' (set to 'Cloud-Manager-Operator-VZzSSP9-SnapCenter'), and an 'AWS Managed Encryption' toggle switch (disabled). A note below the role name says 'Master Key: aws/ebs (default)' and has a 'Change Key' link. At the bottom of the 'Details' section are 'Previous' and 'Next' buttons, with the 'Next' button being blue. In the top right corner of the main window, there are 'More Information' and 'X' buttons.

7. Configure networking with the proper VPC, subnet, and SSH key pair for EC2 access.

Add BlueXP Connector - AWS

More Information X

AWS Credentials Details Network Security Group Review

### Network

**Connectivity**

## 8. Set the security group for the connector.

Add BlueXP Connector - AWS

More Information X

AWS Credentials Details Network Security Group Review

### Security Group

The security group must allow inbound HTTP, HTTPS and SSH access.

Assign a security group:  Create a new security group  Select an existing security group

Security Group Name	Description
default	default VPC security group

1 Security Group

Previous Next

9. Review the summary page and click **Add** to start connector creation. It generally takes about 10 mins to complete deployment. Once completed, the connector instance appears in the AWS EC2 dashboard.

The screenshot shows the 'Review' step of the 'Add BlueXP Connector - AWS' wizard. The configuration details listed are:

Review	
Code for Terraform Automation	
BlueXP Connector Name	aws-snapctr-us-east
AWS Access Key	AKIAJ4H43ZT56IWWR3TI
Region	us-east-1
VPC	vpc-0b522d5e982a50ceb - 172.30.15.0/25
Subnet	172.30.15.0/25   priv-subnet-01
Key Pair	sufi_new
Public IP	Use subnet settings (Disable)
Proxy	None
Security Group	default

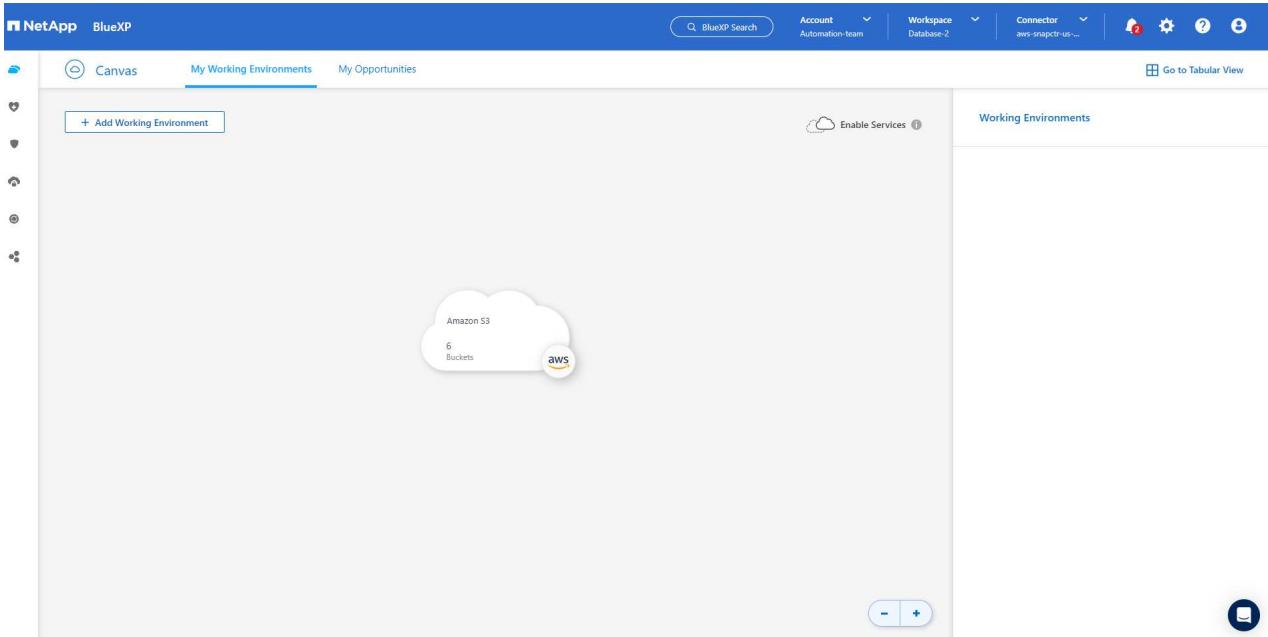

At the bottom of the screen, there are two buttons: 'Previous' and 'Add'. To the right of the buttons is a help icon (a blue circle with a white question mark).

10. After the connector is deployed, log into the connector EC2 host as the ec2-user with an SSH key to install the SnapCenter plug-in following these instructions: [Deploy the plug-in using script and add host from UI using manual option](#).

## SnapCenter services setup

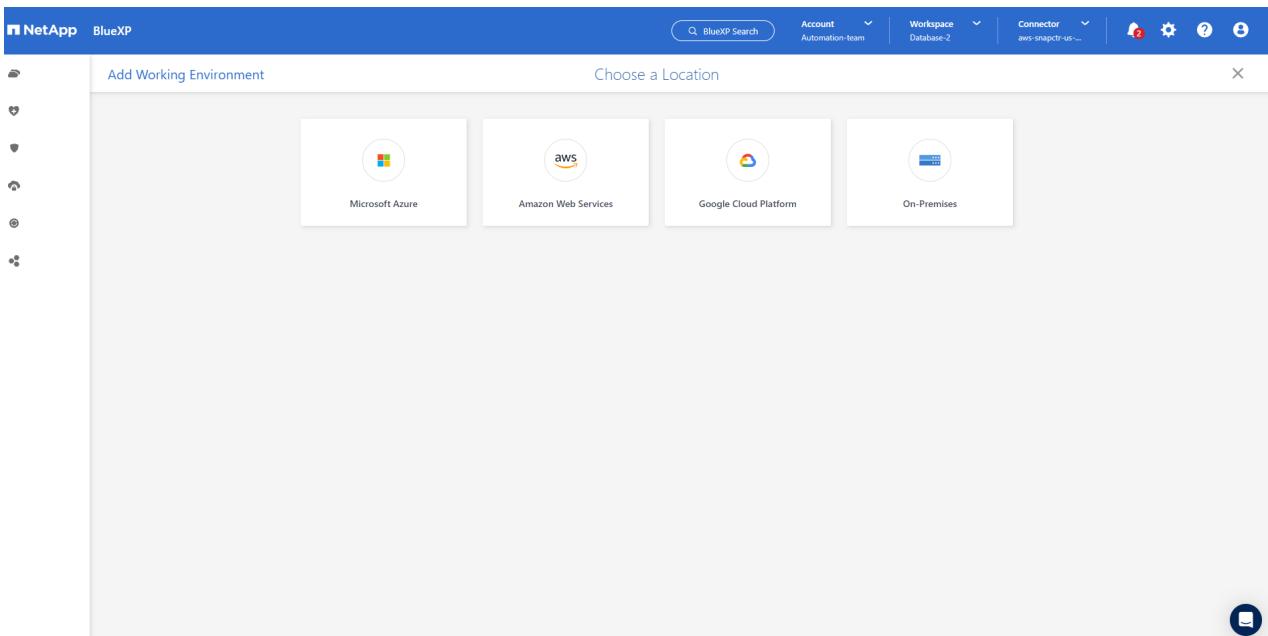

With the connector deployed, SnapCenter services can now be set up with the following procedure:

1. From **My Working Environment** click **Add working Environment** to discover FSx deployed in AWS.

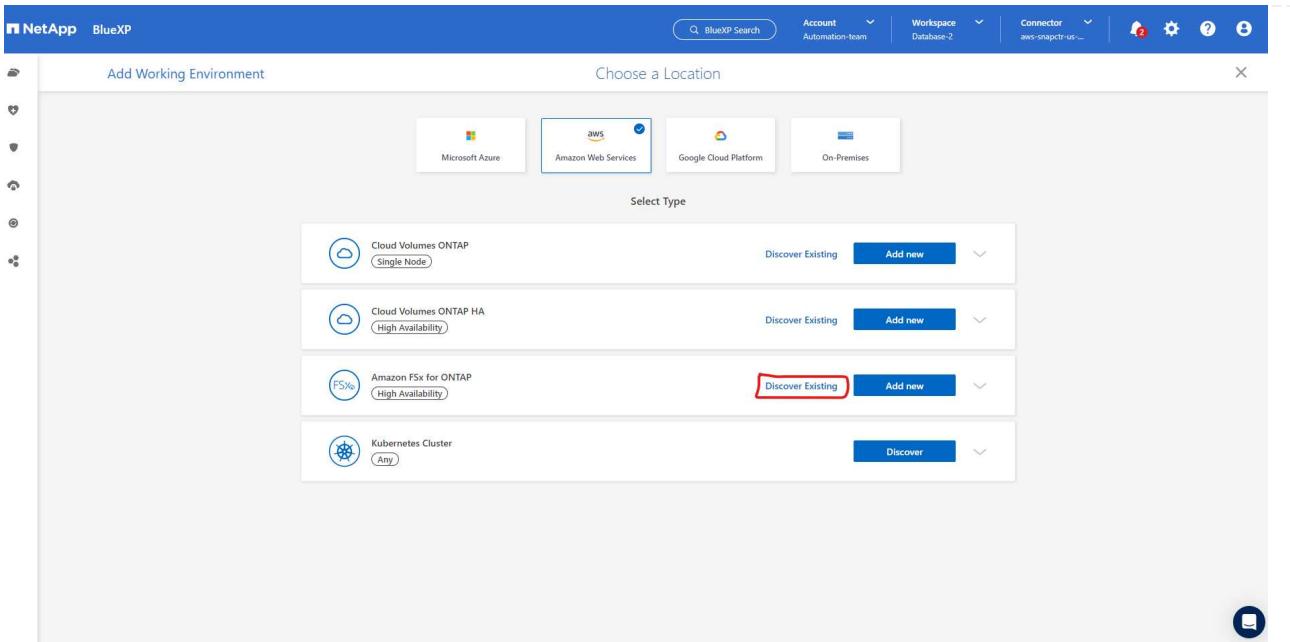

The screenshot shows the NetApp BlueXP web interface. At the top, there's a blue header bar with the NetApp logo and "BlueXP". On the right side of the header are account, workspace, and connector dropdowns, along with various icons for search, settings, and help. Below the header, there are three tabs: "Canvas" (disabled), "My Working Environments" (selected, indicated by a blue underline), and "My Opportunities". In the main content area, there's a large white space with a central "Add Working Environment" button. To the right of this button is a "Working Environments" section. In the middle of the main area is a large, stylized white cloud icon containing the text "Amazon S3" and "6 Buckets". At the bottom right of the main area are two small buttons: a minus sign and a plus sign. On the far right edge of the screen, there are several circular icons for messaging, notifications, and other system functions.

2. Choose **Amazon Web Services** as the location.

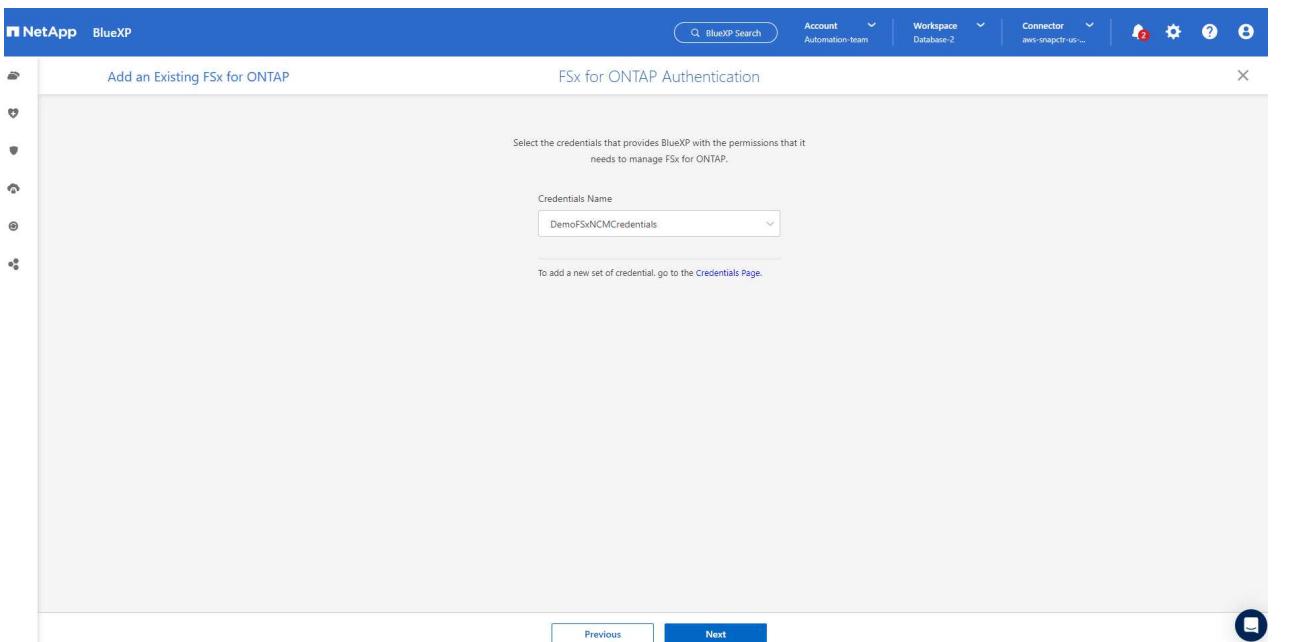

The screenshot shows a modal dialog box titled "Add Working Environment" with the sub-section "Choose a Location". The dialog has a white background and a dark blue header bar at the top with the same NetApp and BlueXP branding as the main interface. In the center of the dialog, there are four square buttons, each representing a different location type: Microsoft Azure (with a Microsoft logo icon), Amazon Web Services (with an AWS logo icon), Google Cloud Platform (with a Google logo icon), and On-Premises (with a server icon). The "Amazon Web Services" button is highlighted with a darker shade, indicating it is selected. The rest of the dialog is mostly empty white space.

3. Click **Discover Existing** next to **Amazon FSx for ONTAP**.

4. Select the credentials that provides BlueXP with the permissions that it needs to manage FSx for ONTAP. If you have not added credentials, you can add it from the **Settings** menu at the top right corner of the BlueXP console.

5. Choose the AWS region where Amazon FSx for ONTAP is deployed, select the FSx cluster that is hosting the Oracle database and click Add.

Add an Existing FSx for ONTAP

Select FSx for ONTAP

Choose an AWS region and then select the working environment that you want to add

Region: us-east-1 | US East (N. Virginia)

Name	File System ID	VPC ID	Subnet ID	Management Address	Deployment modal	Tags
fsx_01	fs-02ad7bf3476b741df	vpc-0b522d5e982a...	subnet-04f5fe7073ff5...	management.fs-02ad7bf3476b741df.fsx.us-east...	Single Availability Zone	(4)

Previous Add

6. The discovered Amazon FSx for ONTAP instance now appears in the working environment.

Canvas My Working Environments My Opportunities

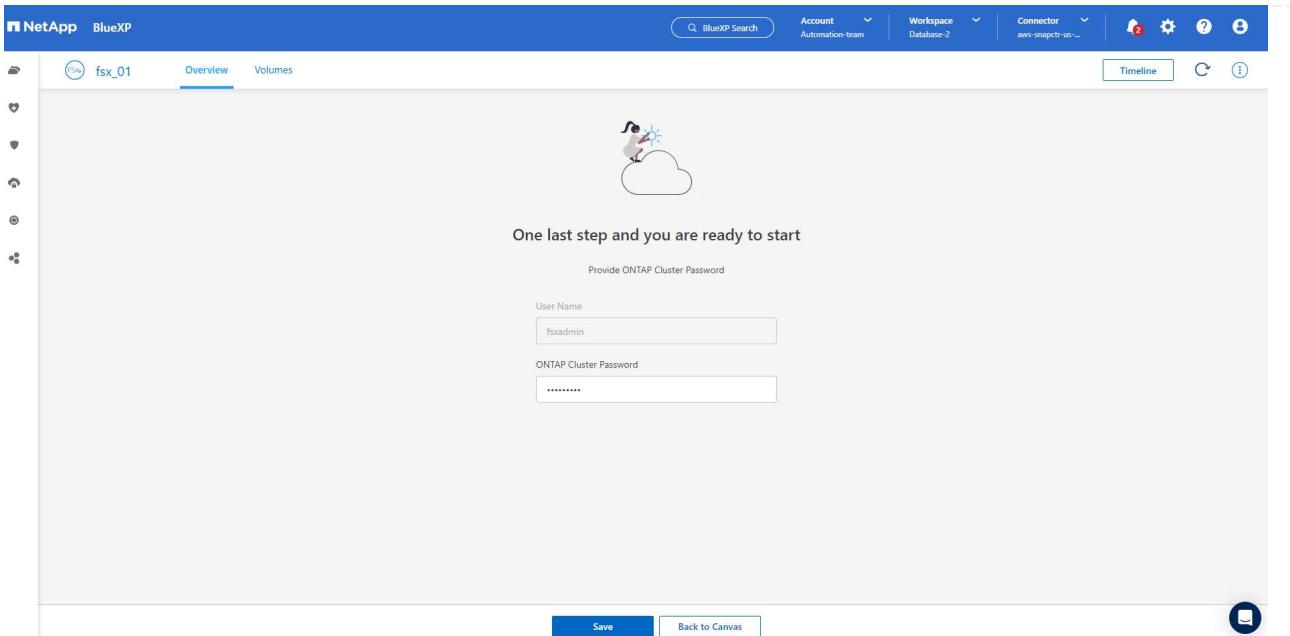

+ Add Working Environment

Enable Services

9. From the left-hand sidebar of the console, hover your mouse over the protection icon, and then click **Protection > Applications** to open the Applications launch page. Click **Discover Applications**.

## 10. Select **Cloud Native** as the application source type.

## 11. Choose **Oracle** for the application type.

12. Provide the Oracle EC2 instance host details to add a host. Check the box to confirm that the plug-in for Oracle on the host has been installed, because you deploy the plug-in after the connector is provisioned.

13. Discover the Oracle EC2 host and add it to **Applications**, and any databases on the host are discovered and displayed on the page as well. The database **Protection Status** shows as **Unprotected**.

The screenshot shows the NetApp BlueXP web interface. At the top, there are navigation tabs: Backup and recovery, Volumes, Restore, Applications (which is selected), Virtual Machines, Kubernetes, and Job Monitoring. The top right includes search, account, workspace, connector, and notification icons. Below the tabs, there's a summary section with counts for Hosts (1), ORACLE (1), and Clone (0). A 'Cloud Native' dropdown is set to Oracle. To the right is an 'Application Protection' box showing 0 Protected and 1 Unprotected. The main area displays a table titled '1 Databases' with one entry: db1, Host Name 172.30.15.58, Policy Name (empty), Protection Status Unprotected. There are buttons for 'Manage Databases' and 'Settings'.

This completes the initial setup of SnapCenter services for Oracle. The next three sections of this document describe Oracle database backup, restore, and clone operations.

## Oracle database backup

- Click the three dots next to the database **Protection Status**, and then click **Policies** to view the default preloaded database protection policies that can be applied to protect your Oracle databases.

The screenshot shows the NetApp BlueXP interface with the Applications tab selected. At the top, there are dropdown menus for Cloud Native and Oracle. Below this, a summary bar shows 1 Host, 1 Oracle application, and 0 Clones. To the right, a box titled "Application Protection" shows 0 Protected and 1 Unprotected. The main table below lists 1 database named db1 with host name 172.30.15.58, which is currently Unprotected. A tooltip for the Protection Status column indicates 0 Protected and 1 Unprotected.

- You can also create your own policy with a customized backup frequency and backup data-retention window.

The screenshot shows the NetApp BlueXP interface with the Policies page for Oracle selected. The table lists four policies:

Policy Name	Backup Type	Schedules and Retention
Oracle Full Backup for Bronze	FullBackup	Daily: Repeats Every 1 Day, Keeps 14 copies Weekly: Repeats Every Fri, Keeps 4 copies Monthly: Repeats Every 1st Day of Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov
Oracle Full Backup for Gold	FullBackup	Hourly: Repeats Every 6 Hrs, Keeps 16 copies Daily: Repeats Every 1 Day, Keeps 30 copies Weekly: Repeats Every Fri, Keeps 4 copies Monthly: Repeats Every 1st Day of Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov
Oracle Full Backup for Silver	FullBackup	Hourly: Repeats Every 12 Hrs, Keeps 6 copies Daily: Repeats Every 1 Day, Keeps 14 copies Weekly: Repeats Every Fri, Keeps 4 copies Monthly: Repeats Every 1st Day of Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov
my_full_bkup	FullBackup	Hourly: Repeats Every 1 Hr, Keeps 3 Days

- When you are happy with the policy configuration, you can then assign your policy of choice to protect the database.

Oracle Full Backup for Gold	FullBackup	Hourly: Repeats Every 6 Hrs, Keeps 16 copies Daily: Repeats Every 1 Day, Keeps 30 copies Weekly: Repeats Every Fri, Keeps 4 copies Monthly: Repeats Every 1st Day of Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, C
Oracle Full Backup for Silver	FullBackup	Hourly: Repeats Every 12 Hrs, Keeps 6 copies Daily: Repeats Every 1 Day, Keeps 14 copies Weekly: Repeats Every Fri, Keeps 4 copies Monthly: Repeats Every 1st Day of Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, C
my_full_bkup	FullBackup	Hourly: Repeats Every 1 Hr, Keeps 3 Days

1 - 4 of 4

Cancel Assign

#### 5. After the policy is applied, the database protection status changed to **Protected** with a green check mark.

The screenshot shows the NetApp BlueXP web interface. At the top, there are navigation tabs: Backup and recovery, Volumes, Restore, Applications (which is selected), Virtual Machines, Kubernetes, and Job Monitoring. Below the tabs, there are two dropdown menus: 'Cloud Native' and 'Oracle'. A summary box displays counts for Hosts (1), ORACLE (1), and Clone (0). An 'Application Protection' section shows 1 Protected and 0 Unprotected. The main area is titled '1 Databases' and contains a table with one row:

Name	Host Name	Policy Name	Protection Status
db1	172.30.15.58	my_full_bkup	Protected

At the bottom right of the table, there are navigation arrows for '1 - 1 of 1'.

6. The database backup runs on a predefined schedule. You can also run a one-off on-demand backup as shown below.

The screenshot shows the same NetApp BlueXP interface as above, but with a context menu open over the 'db1' database entry in the table. The menu options are: View Details, On-Demand Backup (which is highlighted with a red underline), Assign Policy, and Un-assign Policy.

7. The database backups details can be viewed by clicking **View Details** from the menu list. This includes the backup name, backup type, SCN, and backup date. A backup set covers a snapshot for both data volume and log volume. A log volume snapshot takes place right after a database volume snapshot. You can apply a filter if you are looking for a particular backup in a long list.

The screenshot shows the NetApp BlueXP interface. The top navigation bar includes 'NetApp BlueXP' logo, 'BlueXP Search' search bar, 'Account Automation-team', 'Workspace Database-2', 'Connector aws-snapctr-us...', and various system icons.

The main menu has tabs: 'Backup and recovery' (selected), 'Volumes', 'Restore', 'Applications' (selected), 'Virtual Machines', 'Kubernetes', and 'Job Monitoring'.

The 'Database Details' section for 'db1' displays the following information:

db1	Protected Protection	Oracle Full Backup for Gold Policy Names	Database Type
Database Name			
172.30.15.58	FSx	Unreachable	bKed8yv2T19BJ0V5QyqvA...
Host Name	Host Storage	Database Version	Agent Id
-	-		
Clones	Parent Database		

Below this, there is a section titled '8 Backups' with a table:

Backup Name	Backup Type	SCN	Backup Date	Action
Oracle_Full_Backup_for_Gold_Weekly_db1_2023_03_24_19_12_18_60900_1	Log	2589354	Mar 24, 2023, 3:12:34 pm	Delete

Oracle_Full_Backup_for_Gold_Hourly_db1_2023_03_24_18_10_31_71953_1	Log	2586621	Mar 24, 2023, 2:10:45 pm	Delete
Oracle_Full_Backup_for_Gold_Hourly_db1_2023_03_24_18_10_03_70535_0	Data	2586557	Mar 24, 2023, 2:10:31 pm	...

## Oracle database restore and recovery

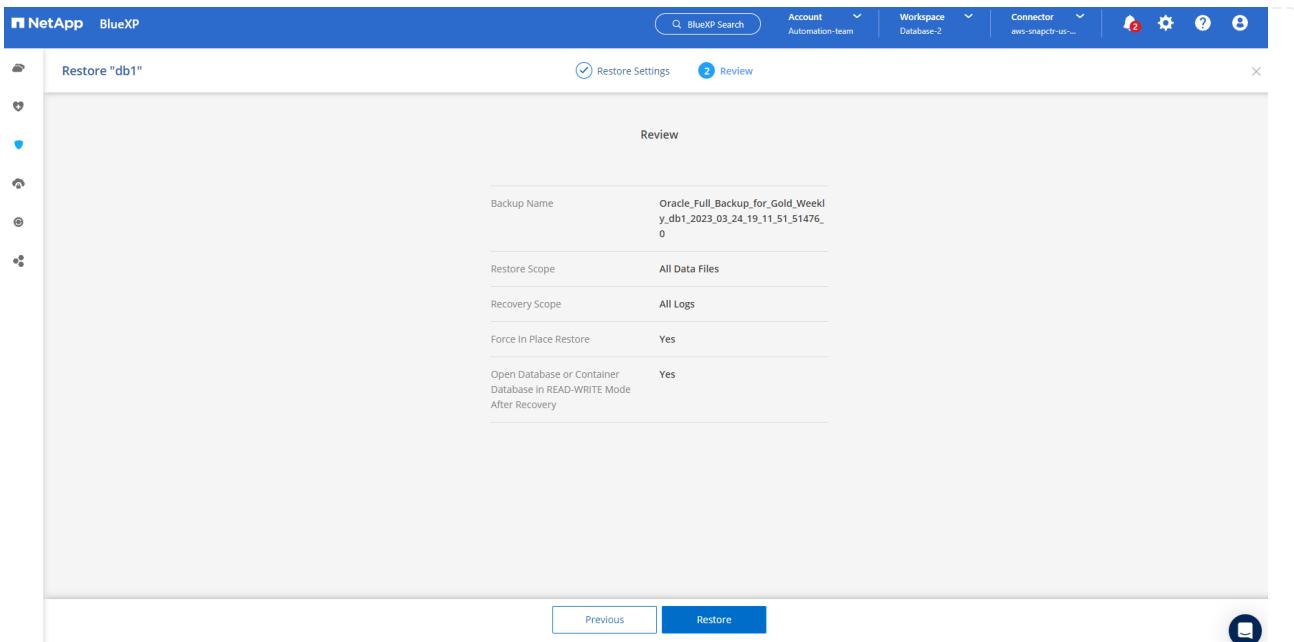

- For a database restore, choose the right backup, either by the SCN or backup time. Click the three dots from the database data backup, and then click **Restore** to initiate database restore and recovery.

The screenshot shows the 'Database Details' section for a database named 'db1'. It displays various configuration details such as Protection, Host Name, Host Storage, and Database Type. Below this, a table lists four backups, each with columns for Backup Name, Backup Type, SCN, and Backup Date. The third backup in the list has a context menu open, with the 'Restore' option highlighted by a red box.

- Choose your restore setting. If you are sure that nothing has changed in the physical database structure after the backup (such as the addition of a data file or a disk group), you can use the **Force in place restore** option, which is generally faster. Otherwise, do not check this box.

The screenshot shows the 'Restore Settings' dialog for restoring database 'db1'. Under 'Restore Scope', the 'All Data Files' radio button is selected. The 'Force in place restore' checkbox is checked. Under 'Recovery Scope', the 'All Logs' radio button is selected. The 'Archive Log Files Locations' field is set to '/mnt/log\_location001'. The 'Next' button is visible at the bottom of the dialog.

- Review and start database restore and recovery.

- From the Job Monitoring tab, you can view the status of the restore job as well as any details while it is running.

Backup and recovery      Volumes      Restore      Applications      Virtual Machines      Kubernetes      Job Monitoring

Job Monitoring      Last Updated: March 24 2023, 15:25:33

## Oracle database clone

To clone a database, launch the clone workflow from the same database backup details page.

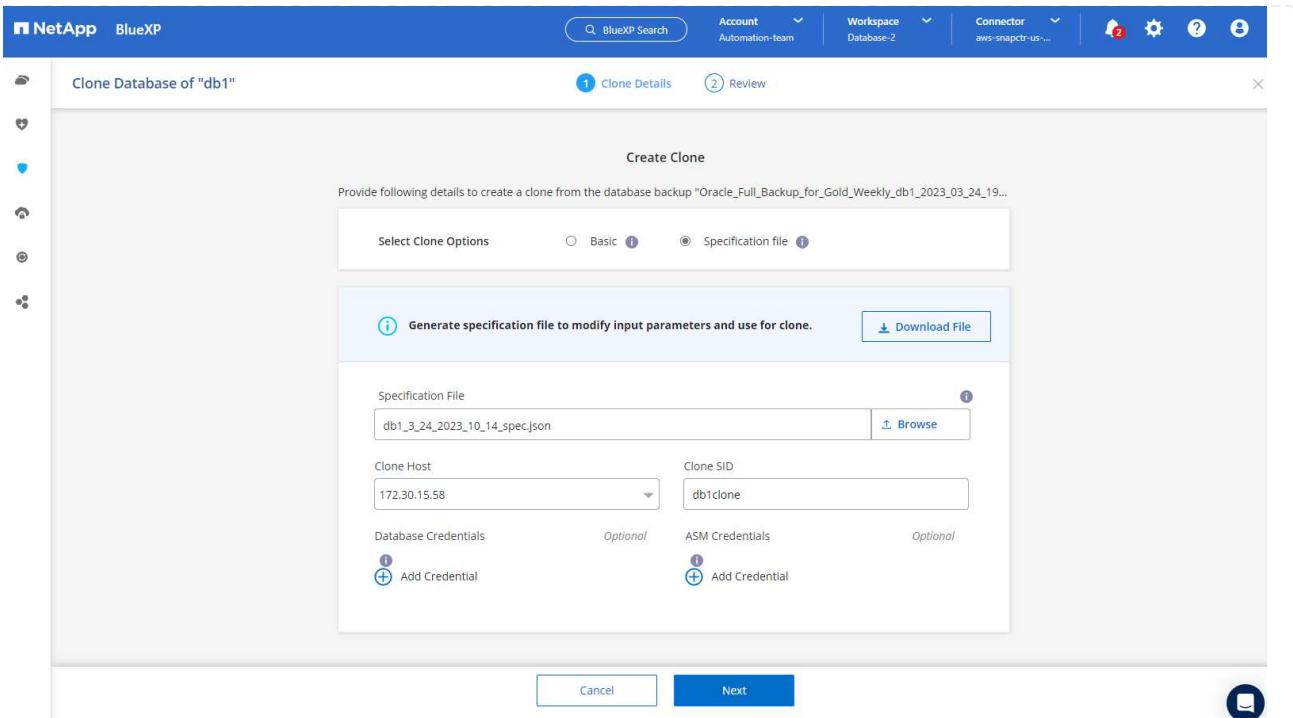

1. Select the right database backup copy, click the three dots to view the menu, and choose the **Clone** option.

The screenshot shows the 'Database Details' section of the NetApp BlueXP interface. It displays a table with columns: Database Name, Protection Status, Oracle Full Backup for Gold Policy Names, and Database Type. Below this is a table for Host Name, Storage Type, Database Version, and Agent ID. At the bottom, there's a 'Clones' section and a 'Parent Database' entry. Below these tables is a 'Backups' section with a table showing two entries: 'Oracle\_Full\_Backup\_for\_Gold\_Hourly\_db1\_2023\_03\_24\_13\_34\_41\_30491\_1' (Log type) and 'Oracle\_Full\_Backup\_for\_Gold\_Hourly\_db1\_2023\_03\_24\_13\_34\_07\_26748\_0' (Data type). A context menu is open over the second backup entry, with the 'Clone' option circled in red.

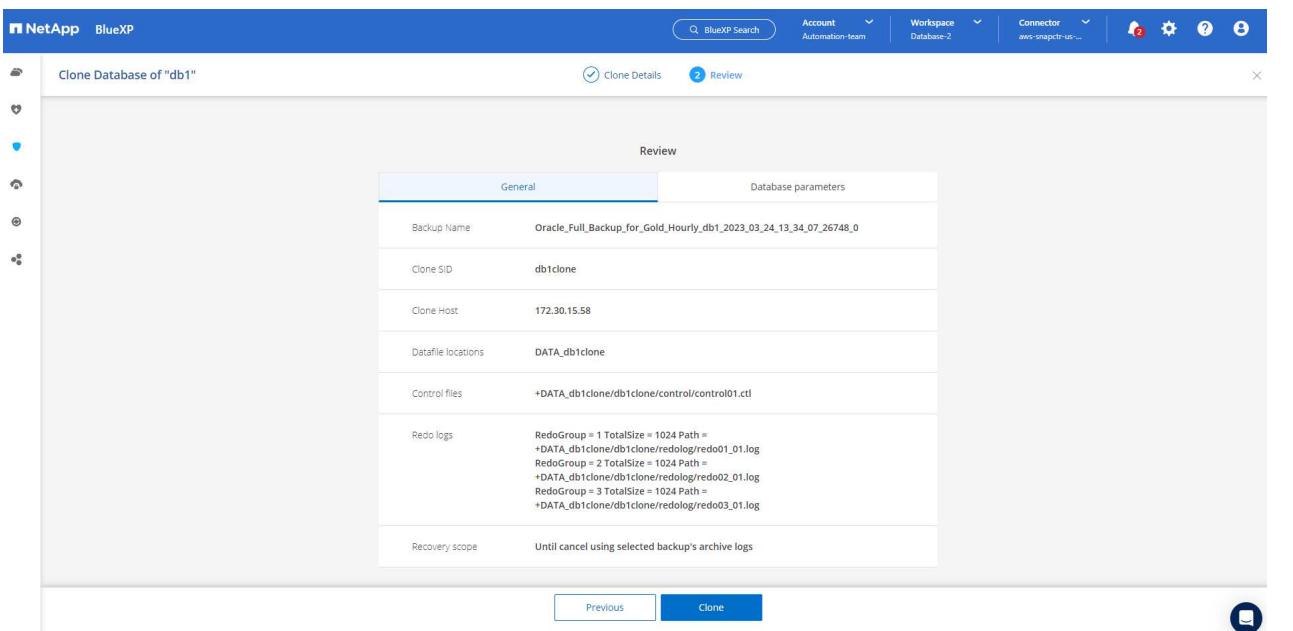

2. Select the **Basic** option if you don't need to change any cloned database parameters.

The screenshot shows the 'Create Clone' wizard step. It has tabs for 'Clone Details' (selected) and 'Review'. The 'Clone Details' tab shows 'Select Clone Options' with a radio button for 'Basic' selected. Below this are fields for 'Clone Host' (172.30.15.58), 'Clone SID' (db1clone), 'Clone Naming Scheme' (Auto-generated), 'Oracle Home' (/u01/app/oracle/product/19.0.0/db1), 'Database Credentials' (Add Credential), and 'ASM Credentials' (Add Credential). At the bottom are 'Cancel' and 'Next' buttons.

3. Alternatively, select **Specification file**, which gives you the option of downloading the current init file, making changes, and then uploading it back to the job.

#### 4. Review and launch the job.

#### 5. Monitor the cloning job status from the **Job Monitoring** tab.

The screenshot shows the NetApp BlueXP interface with the 'Job Monitoring' tab selected. A specific job is being tracked, with its ID visible in the URL. The interface displays 'Job Details' for the main job and lists three sub-jobs under 'Sub-Jobs(2)'. The sub-jobs are:

- Cloning Oracle Database db1 as db1clone on h...
- Running pre scripts
- Validating clone request

## 6. Validate the cloned database on the EC2 instance host.

## Hybrid Cloud Database Solutions with SnapCenter

### TR-4908: Hybrid Cloud Database Solutions with SnapCenter Overview

Alan Cao, Felix Melligan, NetApp

This solution provides NetApp field and customers with instructions and guidance for configuring, operating, and migrating databases to a hybrid cloud environment using the NetApp SnapCenter GUI-based tool and the NetApp storage service CVO in public

clouds for the following use cases:

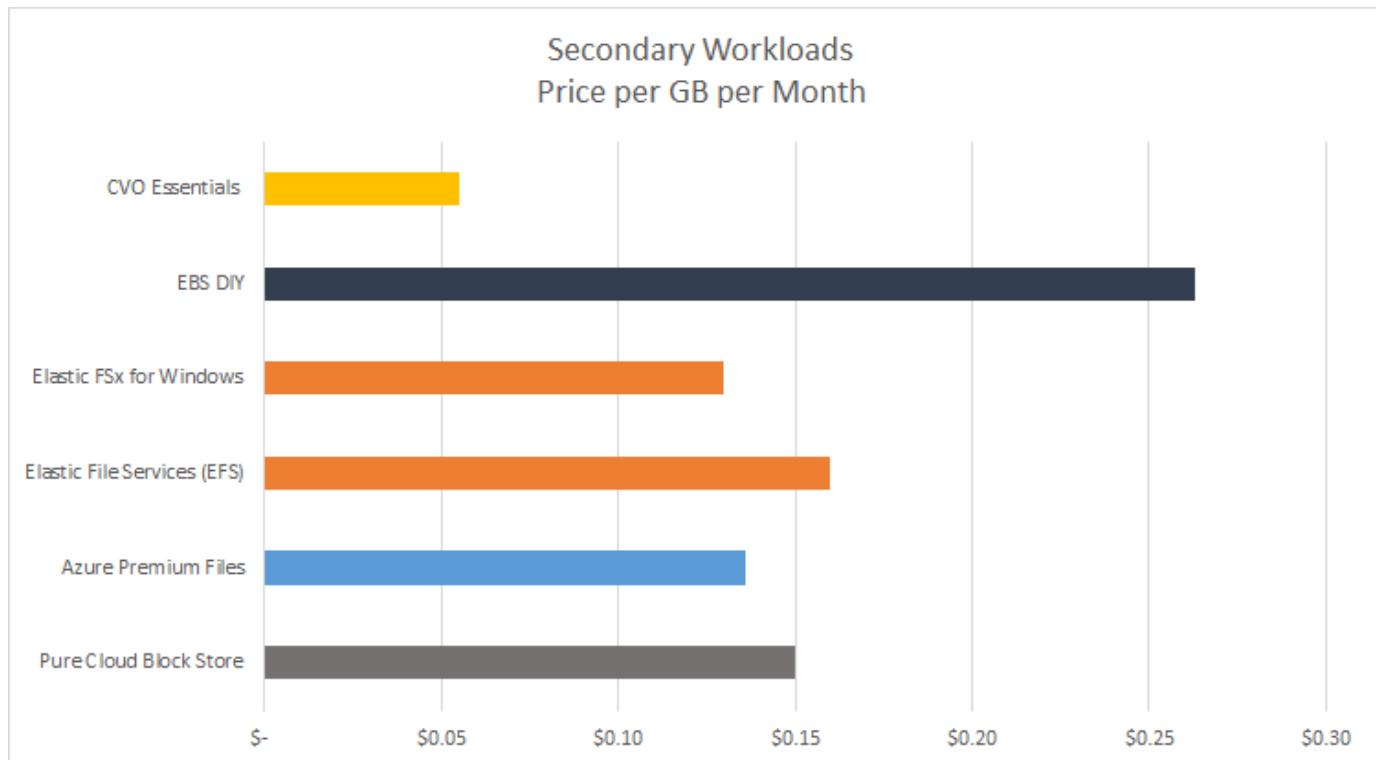

- Database dev/test operations in the hybrid cloud
- Database disaster recovery in the hybrid cloud

Today, many enterprise databases still reside in private corporate data centers for performance, security, and/or other reasons. This hybrid cloud database solution enables enterprises to operate their primary databases on site while using a public cloud for dev/test database operations as well as for disaster recovery to reduce licensing and operational costs.

Many enterprise databases, such as Oracle, SQL Server, SAP HANA, and so on, carry high licensing and operational costs. Many customers pay a one-time license fee as well as annual support costs based on the number of compute cores in their database environment, whether the cores are used for development, testing, production, or disaster recovery. Many of those environments might not be fully utilized throughout the application lifecycle.

The solutions provide an option for customers to potentially reduce their licensable cores count by moving their database environments devoted to development, testing, or disaster recovery to the cloud. By using public-cloud scale, redundancy, high availability, and a consumption-based billing model, the cost saving for licensing and operation can be substantial, while not sacrificing any application usability or availability.

Beyond potential database license-cost savings, the NetApp capacity-based CVO license model allows customers to save storage costs on a per-GB basis while empowering them with high level of database manageability that is not available from competing storage services. The following chart shows a storage cost comparison of popular storage services available in the public cloud.

This solution demonstrates that, by using the SnapCenter GUI-based software tool and NetApp SnapMirror technology, hybrid cloud database operations can be easily setup, implemented, and operated.

The following videos demonstrate SnapCenter in action:

- Backup of an Oracle database across a Hybrid Cloud using SnapCenter
- SnapCenter- Clone DEV/TEST to AWS Cloud for an Oracle database

Notably, although the illustrations throughout this document show CVO as a target storage instance in the public cloud, the solution is also fully validated for the new release of the FSx ONTAP storage engine for AWS.

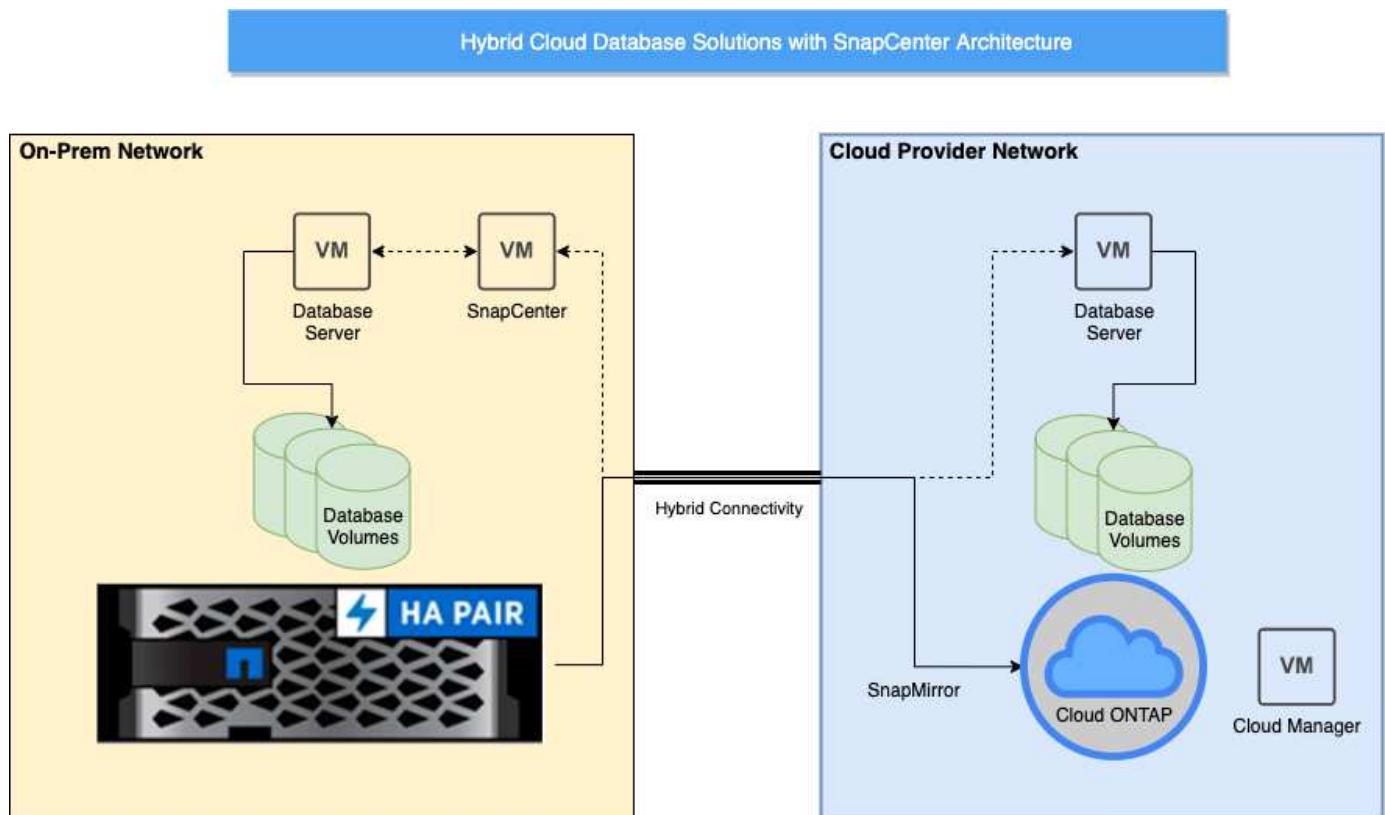

To test drive the solution and use cases for yourself, a NetApp Lab-on-Demand SL10680 can be requested at following xref:./databases/ [TL\\_AWS\\_004 HCoD: AWS - NW,SnapCenter\(OnPrem\)](#).

[Next: Solutions architecture.](#)

## Solution Architecture

[Previous: Introduction.](#)

The following architecture diagram illustrates a typical implementation of enterprise database operation in a hybrid cloud for dev/test and disaster recovery operations.

In normal business operations, synchronized database volumes in the cloud can be cloned and mounted to dev/test database instances for applications development or testing. In the event of a failure, the synchronized database volumes in the cloud can then be activated for disaster recovery.

[Next: Solutions requirements.](#)

## SnapCenter Requirements

[Previous: Solutions architecture.](#)

This solution is designed in a hybrid cloud setting to support on-premises production databases that can burst to all of the popular public clouds for dev/test and disaster recovery operations.

This solution supports all databases that are currently supported by SnapCenter, although only Oracle and SQL Server databases are demonstrated here. This solution is validated with virtualized database workloads, although bare-metal workloads are also supported.

We assume that production database servers are hosted on-premises with DB volumes presented to DB hosts from a ONTAP storage cluster. SnapCenter software is installed on-premises for database backup and data replication to the cloud. An Ansible controller is recommended but not required for database deployment automation or OS kernel and DB configuration syncing with a standby DR instance or dev/test instances in the public cloud.

## Requirements

Environment	Requirements
<b>On-premises</b>	Any databases and versions supported by SnapCenter SnapCenter v4.4 or higher Ansible v2.09 or higher ONTAP cluster 9.x Intercluster LIFs configured Connectivity from on-premises to a cloud VPC (VPN, interconnect, and so on) Networking ports open - ssh 22 - tcp 8145, 8146, 10000, 11104, 11105
<b>Cloud - AWS</b>	<a href="#">Cloud Manager Connector</a> <a href="#">Cloud Volumes ONTAP</a> Matching DB OS EC2 instances to On-prem
<b>Cloud - Azure</b>	<a href="#">Cloud Manager Connector</a> <a href="#">Cloud Volumes ONTAP</a> Matching DB OS Azure Virtual Machines to On-prem
<b>Cloud - GCP</b>	<a href="#">Cloud Manager Connector</a> <a href="#">Cloud Volumes ONTAP</a> Matching DB OS Google Compute Engine instances to on-premises

Next: [Prerequisites configuration](#).

## Prerequisites configuration

Previous: [Solutions requirements](#).

Certain prerequisites must be configured both on-premises and in the cloud before the

execution of hybrid cloud database workloads. The following section provides a high-level summary of this process, and the following links provide further information about necessary system configuration.

## On premises

- SnapCenter installation and configuration
- On-premises database server storage configuration
- Licensing requirements
- Networking and security
- Automation

## Public cloud

- A NetApp Cloud Central login
- Network access from a web browser to several endpoints
- A network location for a connector
- Cloud provider permissions
- Networking for individual services

Important considerations:

1. Where to deploy the Cloud Manager Connector?
2. Cloud Volume ONTAP sizing and architecture
3. Single node or high availability?

The following links provide further details:

### [On Premises](#)

### [Public Cloud](#)

[Next: Prerequisites on-premises.](#)

## Prerequisites on-premises

[Previous: Prerequisites configuration.](#)

The following tasks must be completed on-premises to prepare the SnapCenter hybrid-cloud database workload environment.

### SnapCenter installation and configuration

The NetApp SnapCenter tool is a Windows-based application that typically runs in a Windows domain environment, although workgroup deployment is also possible. It is based on a multitiered architecture that includes a centralized management server (the SnapCenter server) and a SnapCenter plug-in on the database server hosts for database workloads. Here are a few key considerations for hybrid-cloud deployment.

- **Single instance or HA deployment.** HA deployment provides redundancy in the case of a single

SnapCenter instance server failure.

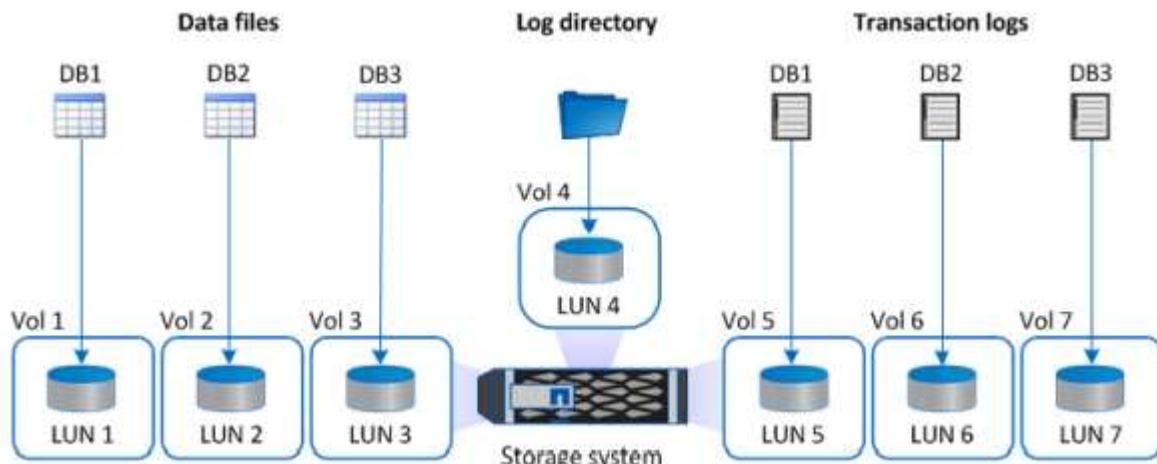

- **Name resolution.** DNS must be configured on the SnapCenter server to resolve all database hosts as well as on the storage SVM for forward and reverse lookup. DNS must also be configured on database servers to resolve the SnapCenter server and the storage SVM for both forward and reverse lookup.
- **Role-based access control (RBAC) configuration.** For mixed database workloads, you might want to use RBAC to segregate management responsibility for different DB platform such as an admin for Oracle database or an admin for SQL Server. Necessary permissions must be granted for the DB admin user.
- **Enable policy-based backup strategy.** To enforce backup consistency and reliability.
- **Open necessary network ports on the firewall.** For the on-premises SnapCenter server to communicate with agents installed in the cloud DB host.
- **Ports must be open to allow SnapMirror traffic between on-prem and public cloud.** The SnapCenter server relies on ONTAP SnapMirror to replicate onsite Snapshot backups to cloud CVO storage SVMs.

After careful pre-installation planning and consideration, click this [SnapCenter installation workflow](#) for details of SnapCenter installation and configuration.

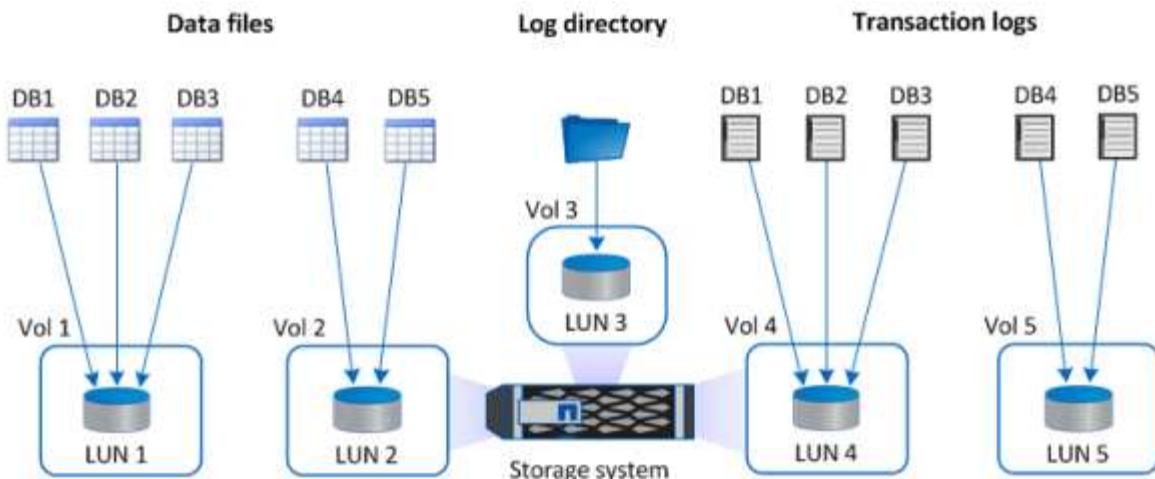

#### On-premises database server storage configuration

Storage performance plays an important role in the overall performance of databases and applications. A well-designed storage layout can not only improve DB performance but also make it easy to manage database backup and recovery. Several factors should be considered when defining your storage layout, including the size of the database, the rate of expected data change for the database, and the frequency with which you perform backups.

Directly attaching storage LUNs to the guest VM by either NFS or iSCSI for virtualized database workloads generally provides better performance than storage allocated via VMDK. NetApp recommends the storage layout for a large SQL Server database on LUNs depicted in the following figure.

The following figure shows the NetApp recommended storage layout for small or medium SQL Server database on LUNs.

The Log directory is dedicated to SnapCenter to perform transaction log rollup for database recovery. For an extra large database, multiple LUNs can be allocated to a volume for better performance.

For Oracle database workloads, SnapCenter supports database environments backed by ONTAP storage that are mounted to the host as either physical or virtual devices. You can host the entire database on a single or multiple storage devices based on the criticality of the environment. Typically, customers isolate data files on dedicated storage from all other files such as control files, redo files, and archive log files. This helps administrators to quickly restore (ONTAP single-file SnapRestore) or clone a large critical database (petabyte scale) using Snapshot technology within few seconds to minutes.

For mission critical workloads that are sensitive to latency, a dedicated storage volume should be deployed to different types of Oracle files to achieve the best latency possible. For a large database, multiple LUNs (NetApp recommends up to eight) per volume should be allocated to data files.

For smaller Oracle databases, SnapCenter supports shared storage layouts in which you can host multiple databases or part of a database on the same storage volume or LUN. As an example of this layout, you can host data files for all the databases on a +DATA ASM disk group or a volume group. The remainder of the files (redo, archive log, and control files) can be hosted on another dedicated disk group or volume group (LVM). Such a deployment scenario is illustrated below.

To facilitate the relocation of Oracle databases, the Oracle binary should be installed on a separate LUN that is included in the regular backup policy. This ensures that in the case of database relocation to a new server host, the Oracle stack can be started for recovery without any potential issues due to an out-of-sync Oracle binary.

#### Licensing requirements

SnapCenter is licensed software from NetApp. It is generally included in an on-premises ONTAP license. However, for hybrid cloud deployment, a cloud license for SnapCenter is also required to add CVO to SnapCenter as a target data replication destination. Please review following links for SnapCenter standard capacity-based license for details:

#### [SnapCenter standard capacity-based licenses](#)

#### Networking and security

In a hybrid database operation that requires an on-premises production database that is burstable to cloud for dev/test and disaster recovery, networking and security is important factor to consider when setting up the environment and connecting to the public cloud from an on-premises data center.

Public clouds typically use a virtual private cloud (VPC) to isolate different users within a public-cloud platform. Within an individual VPC, security is controlled using measures such as security groups that are configurable based on user needs for the lockdown of a VPC.

The connectivity from the on-premises data center to the VPC can be secured through a VPN tunnel. On the VPN gateway, security can be hardened using NAT and firewall rules that block attempts to establish network connections from hosts on the internet to hosts inside the corporate data center.

For networking and security considerations, review the relevant inbound and outbound CVO rules for your public cloud of choice:

- [Security group rules for CVO - AWS](#)
- [Security group rules for CVO - Azure](#)
- [Firewall rules for CVO - GCP](#)

#### Using Ansible automation to sync DB instances between on-premises and the cloud - optional

To simplify management of a hybrid-cloud database environment, NetApp highly recommends but does not require that you deploy an Ansible controller to automate some management tasks, such as keeping compute instances on-premises and in the cloud in sync. This is particular important because an out-of-sync compute instance in the cloud might render the recovered database in the cloud error prone because of missing kernel packages and other issues.

The automation capability of an Ansible controller can also be used to augment SnapCenter for certain tasks, such as breaking up the SnapMirror instance to activate the DR data copy for production.

Follow these instruction to set up your Ansible control node for RedHat or CentOS machines: [RedHat/CentOS Ansible Controller Setup](#).

Follow these instruction to set up your Ansible control node for Ubuntu or Debian machines: [Ubuntu/Debian Ansible Controller Setup](#).

Next: Public cloud.

## Prerequisites for the public cloud

Previous: [Prerequisites on-premises](#).

Before we install the Cloud Manager connector and Cloud Volumes ONTAP and configure SnapMirror, we must perform some preparation for our cloud environment. This page describes the work that needs to be done as well as the considerations when deploying Cloud Volumes ONTAP.

### Cloud Manager and Cloud Volumes ONTAP deployment prerequisites checklist

- A NetApp Cloud Central login
- Network access from a web browser to several endpoints
- A network location for a Connector
- Cloud provider permissions
- Networking for individual services

For more information about what you need to get started, visit our [cloud documentation](#).

## Considerations

### 1. What is a Cloud Manager connector?

In most cases, a Cloud Central account admin must deploy a connector in your cloud or on-premises network. The connector enables Cloud Manager to manage resources and processes within your public cloud environment.

For more information about Connectors, visit our [cloud documentation](#).

### 2. Cloud Volumes ONTAP sizing and architecture

When deploying Cloud Volumes ONTAP, you are given the choice of either a predefined package or the creation of your own configuration. Although many of these values can be changed later on nondisruptively, there are some key decisions that need to be made before deployment based on the workloads to be deployed in the cloud.

Each cloud provider has different options for deployment and almost every workload has its own unique properties. NetApp has a [CVO sizing tool](#) that can help size deployments correctly based on capacity and performance, but it has been built around some basic concepts which are worth considering:

- Capacity required
- Network capability of the cloud virtual machine
- Performance characteristics of cloud storage

The key is to plan for a configuration that not only satisfies the current capacity and performance requirements, but also looks at future growth. This is generally known as capacity headroom and performance headroom.

If you would like further information, read the documentation about planning correctly for [AWS](#), [Azure](#), and [GCP](#).

### 3. Single node or high availability?

In all clouds, there is the option to deploy CVO in either a single node or in a clustered high availability pair with two nodes. Depending on the use case, you might wish to deploy a single node to save costs or an HA pair to provide further availability and redundancy.

For a DR use case or spinning up temporary storage for development and testing, single nodes are common since the impact of a sudden zonal or infrastructure outage is lower. However, for any production use case, when the data is in only a single location, or when the dataset must have more redundancy and availability, high availability is recommended.

For further information about the architecture of each cloud's version of high availability, visit the documentation for [AWS](#), [Azure](#) and [GCP](#).

Next: [Getting started overview](#).

## Getting started overview

Previous: [Prerequisites for the public cloud](#).

This section provides a summary of the tasks that must be completed to meet the prerequisite requirements as outlined in previous section. The following section provide a high level tasks list for both on-premises and public cloud operations. The detailed processes and procedures can be accessed by clicking on the relevant links.

### On-premises

- Setup database admin user in SnapCenter
- SnapCenter plugin installation prerequisites
- SnapCenter host plugin installation
- DB resource discovery
- Setup storage cluster peering and DB volume replication
- Add CVO database storage SVM to SnapCenter
- Setup database backup policy in SnapCenter
- Implement backup policy to protect database
- Validate backup

### AWS public cloud

- Pre-flight check
- Steps to deploy Cloud Manager and Cloud Volumes ONTAP in AWS
- Deploy EC2 compute instance for database workload

Click the following links for details:

[On Premises, Public Cloud - AWS](#)

## Getting started on premises

[Previous: Getting started overview.](#)

### On Premises

#### 1. Setup database admin user in SnapCenter

The NetApp SnapCenter tool uses role-based access control (RBAC) to manage user resources access and permission grants, and SnapCenter installation creates prepopulated roles. You can also create custom roles based on your needs or applications. It makes sense to have a dedicated admin user ID for each database platform supported by SnapCenter for database backup, restoration, and/or disaster recovery. You can also use a single ID to manage all databases. In our test cases and demonstration, we created a dedicated admin user for both Oracle and SQL Server, respectively.

Certain SnapCenter resources can only be provisioned with the SnapCenterAdmin role. Resources can then be assigned to other user IDs for access.

In a pre-installed and configured on-premises SnapCenter environment, the following tasks might have already have been completed. If not, the following steps create a database admin user:

1. Add the admin user to Windows Active Directory.
2. Log into SnapCenter using an ID granted with the SnapCenterAdmin role.
3. Navigate to the Access tab under Settings and Users, and click Add to add a new user. The new user ID is linked to the admin user created in Windows Active Directory in step 1. . Assign the proper role to the user as needed. Assign resources to the admin user as applicable.

	Name	Type	Roles	Domain
<input type="checkbox"/>	administrator	User	SnapCenterAdmin	demo
<input type="checkbox"/>	oradb	User	App Backup and Clone Admin	demo
<input type="checkbox"/>	sqldba	User	App Backup and Clone Admin	demo

#### 2. SnapCenter plugin installation prerequisites

SnapCenter performs backup, restore, clone, and other functions by using a plugin agent running on the DB hosts. It connects to the database host and database via credentials configured under the Setting and Credentials tab for plugin installation and other management functions. There are specific privilege requirements based on the target host type, such as Linux or Windows, as well as the type of database.

DB hosts credentials must be configured before SnapCenter plugin installation. Generally, you want to use an administrator user accounts on the DB host as your host connection credentials for plugin installation. You can also grant the same user ID for database access using OS-based authentication. On the other hand, you can also employ database authentication with different database user IDs for DB management access. If you

decide to use OS-based authentication, the OS admin user ID must be granted DB access. For Windows domain-based SQL Server installation, a domain admin account can be used to manage all SQL Servers within the domain.

Windows host for SQL server:

1. If you are using Windows credentials for authentication, you must set up your credential before installing plugins.
2. If you are using a SQL Server instance for authentication, you must add the credentials after installing plugins.
3. If you have enabled SQL authentication while setting up the credentials, the discovered instance or database is shown with a red lock icon. If the lock icon appears, you must specify the instance or database credentials to successfully add the instance or database to a resource group.
4. You must assign the credential to a RBAC user without sysadmin access when the following conditions are met:
  - The credential is assigned to a SQL instance.
  - The SQL instance or host is assigned to an RBAC user.
  - The RBAC DB admin user must have both the resource group and backup privileges.

Unix host for Oracle:

1. You must have enabled the password-based SSH connection for the root or non-root user by editing sshd.conf and restarting the sshd service. Password-based SSH authentication on AWS instance is turned off by default.
2. Configure the sudo privileges for the non-root user to install and start the plugin process. After installing the plugin, the processes run as an effective root user.
3. Create credentials with the Linux authentication mode for the install user.
4. You must install Java 1.8.x (64-bit) on your Linux host.
5. Installation of the Oracle database plugin also installs the SnapCenter plugin for Unix.

### 3. SnapCenter host plugin installation

Before attempting to install SnapCenter plugins on cloud DB server instances, make sure that all configuration steps have been completed as listed in the relevant cloud section for compute instance deployment.

The following steps illustrate how a database host is added to SnapCenter while a SnapCenter plugin is installed on the host. The procedure applies to adding both on-premises hosts and cloud hosts. The following demonstration adds a Windows or a Linux host residing in AWS.

#### Configure SnapCenter VMware global settings

Navigate to Settings > Global Settings. Select "VMs have iSCSI direct attached disks or NFS for all the hosts" under Hypervisor Settings and click Update.

## Add Windows host and installation of plugin on the host

1. Log into SnapCenter with a user ID with SnapCenterAdmin privileges.
2. Click the Hosts tab from the left-hand menu, and then click Add to open the Add Host workflow.
3. Choose Windows for Host Type; the Host Name can be either a host name or an IP address. The host name must be resolved to the correct host IP address from the SnapCenter host. Choose the host credentials created in step 2. Choose Microsoft Windows and Microsoft SQL Server as the plugin packages to be installed.

4. After the plugin is installed on a Windows host, its Overall Status is shown as "Configure log directory."

Name	Type	System	Plug-in	Version	Overall Status
rhel2.demo.netapp.com	Linux	Stand-alone	UNIX, Oracle Database	4.5	Running
sql1.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	Running
sql-standby.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	Configure log directory

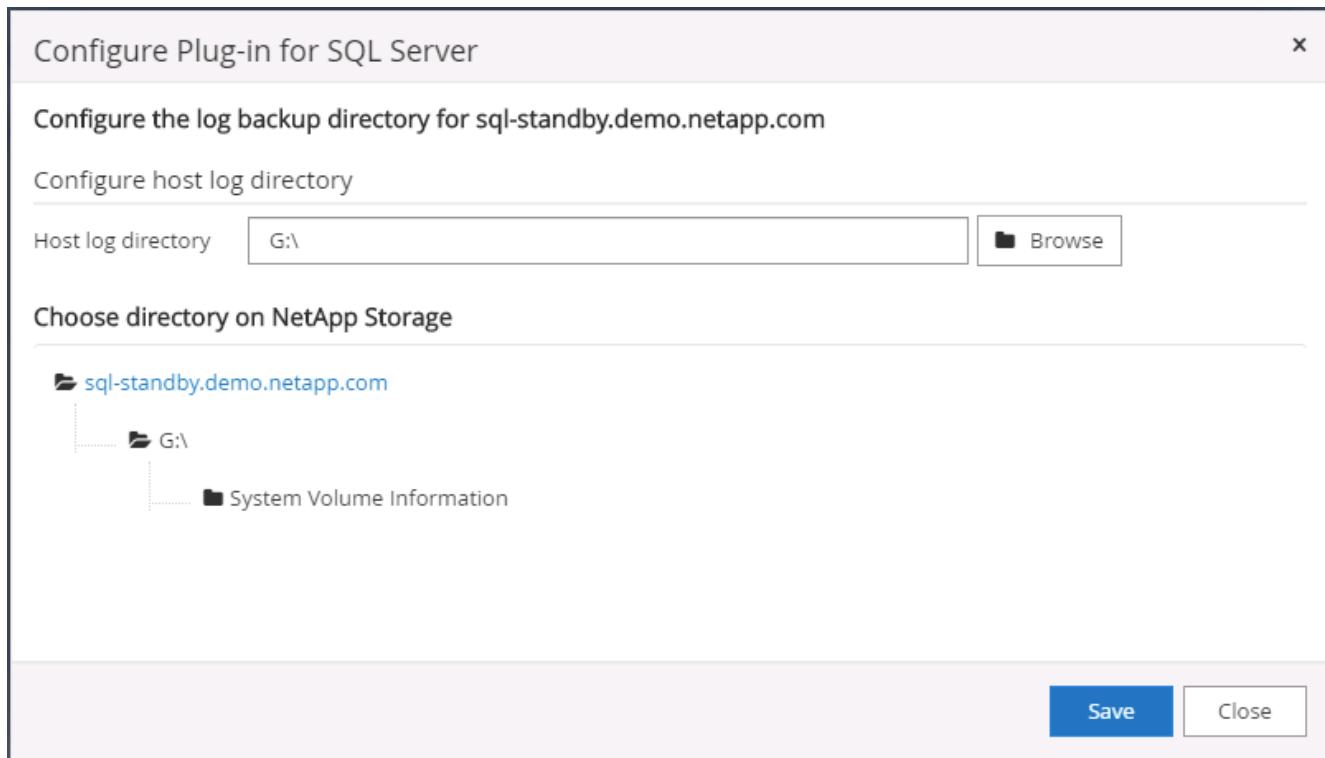

5. Click the Host Name to open the SQL Server log directory configuration.

The screenshot shows the NetApp SnapCenter interface. On the left, there's a sidebar with icons for hosts, storage, and logs. The main area has a title bar "NetApp SnapCenter®" and tabs "Managed Hosts" and "Alerts". Under "Managed Hosts", there's a search bar "Search by Name" and a list of hosts: "Name" (checkbox), "Host IP" (checkbox), "Overall Status" (checkbox), "Host Type" (checkbox), "System" (checkbox), "Credentials" (checkbox), and "Plug-ins" (checkbox). The host "sql-standby.demo.netapp.com" is selected and highlighted in blue. To the right, the "Host Details" panel shows the host name as "sql-standby.demo.netapp.com", host IP as "10.221.2.56", overall status as "Configure log directory", host type as "Windows", system as "Stand-alone", credentials as "Domain Admin", and plug-ins as "SnapCenter Plug-ins package 4.5.0.6123 for Windows" (Microsoft Windows, Microsoft SQL Server). At the bottom are buttons for "Submit", "Cancel", and "Reset".

6. Click "Configure log directory" to open "Configure Plug-in for SQL Server."

The screenshot shows the "Configure Plug-in for SQL Server" dialog box. The title bar says "Configure Plug-in for SQL Server". The main content area is titled "Configure the log backup directory for sql-standby.demo.netapp.com". Below it, there's a section titled "Configure host log directory" with a "Host log directory" label and a "dedicated disk directory path" input field containing the placeholder "dedicated disk directory path". To the right of the input field is a "Browse" button with a folder icon. At the bottom right of the dialog are "Save" and "Close" buttons.

7. Click Browse to discover NetApp storage so that a log directory can be set; SnapCenter uses this log directory to roll up the SQL server transaction log files. Then click Save.

For NetApp storage provisioned to a DB host to be discovered, the storage (on-prem or CVO) must be added to SnapCenter, as illustrated in step 6 for CVO as an example.

- After the log directory is configured, the Windows host plugin Overall Status is changed to Running.

Name	Type	System	Plug-in	Version	Overall Status
rhel2.demo.netapp.com	Linux	Stand-alone	UNIX, Oracle Database	4.5	<span style="color: green;">Running</span>
sql1.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	<span style="color: green;">Running</span>
sql-standby.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	<span style="color: green;">Running</span>

- To assign the host to the database management user ID, navigate to the Access tab under Settings and Users, click the database management user ID (in our case the sqldba that the host needs to be assigned to), and click Save to complete host resource assignment.

Name	Type	Roles	Domain
administrator	User	SnapCenterAdmin	demo
oradba	User	App Backup and Clone Admin	demo
sqldba	User	App Backup and Clone Admin	demo

Assign Assets

Asset Type: Host

search

<input type="checkbox"/>	Asset Name

### Add Unix host and installation of plugin on the host

1. Log into SnapCenter with a user ID with SnapCenterAdmin privileges.
2. Click the Hosts tab from left-hand menu, and click Add to open the Add Host workflow.
3. Choose Linux as the Host Type. The Host Name can be either the host name or an IP address. However, the host name must be resolved to correct host IP address from SnapCenter host. Choose host credentials created in step 2. The host credentials require sudo privileges. Check Oracle Database as the plug-in to be installed, which installs both Oracle and Linux host plugins.

Add Host

Host Type: Linux

Host Name: ora-standby

Credentials: admin

Select Plug-ins to Install SnapCenter Plug-ins Package 4.5 for Linux

Oracle Database  
 SAP HANA

[More Options](#) : Port, Install Path, Custom Plug-ins...

**Submit** **Cancel**

4. Click More Options and select "Skip preinstall checks." You are prompted to confirm the skipping of the preinstall check. Click Yes and then Save.

More Options

Port	8145	<a href="#">i</a>
Installation Path	/opt/NetApp/snapcenter	<a href="#">i</a>
<input checked="" type="checkbox"/> Skip preinstall checks <input checked="" type="checkbox"/> Add all hosts in the oracle RAC		
Custom Plug-ins		
Choose a File <a href="#">Browse</a> <a href="#">Upload</a>		
No plug-ins found.		
<a href="#">Save</a> <a href="#">Cancel</a>		

5. Click Submit to start the plugin installation. You are prompted to Confirm Fingerprint as shown below.

Confirm Fingerprint

Authenticity of the host cannot be determined [i](#)

Host name	<a href="#">Edit</a>	Fingerprint	Valid
ora-standby.demo.netapp.com		ssh-rsa 3072 5C:02:EF:6B:63:54:59:10:84:DF:4D:6B:AB:FB:61:67	

[Confirm and Submit](#) [Close](#)

6. SnapCenter performs host validation and registration, and then the plugin is installed on the Linux host. The status is changed from Installing Plugin to Running.

Name	Type	System	Plug-in	Version	Overall Status
ora-standby.demo.netapp.com	Linux	Stand-alone	UNIX, Oracle Database	4.5	Running
rhel2.demo.netapp.com	Linux	Stand-alone	UNIX, Oracle Database	4.5	Running
sql1.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	Running
sql-standby.demo.netapp.com	Windows	Stand-alone	Microsoft Windows Server, Microsoft SQL Server	4.5	Running

7. Assign the newly added host to the proper database management user ID (in our case, oradba).

User Name: oradba  
Domain: demo  
Roles: App Backup and Clone Admin

Asset Name	Type	Asset Type
10.0.0.1	DataOntapCluster	Storage Connection
192.168.0.101	DataOntapCluster	Storage Connection
admin		Credentials
Linux Admin		Credentials
Oracle Archive Log Backup		Policy
Oracle Full Online Backup		Policy
rhel2.demo.netapp.com		host

Asset Type: Host

Asset Name
<input checked="" type="checkbox"/> ora-standby.demo.netapp.com
<input type="checkbox"/> rhel2.demo.netapp.com
<input type="checkbox"/> sql1.demo.netapp.com
<input type="checkbox"/> sql-standby.demo.netapp.com

Save Close

#### 4. Database resource discovery

With successful plugin installation, the database resources on the host can be immediately discovered. Click the Resources tab in the left-hand menu. Depending on the type of database platform, a number of views are available, such as the database, resources group, and so on. You might need to click the Refresh Resources tab if the resources on the host are not discovered and displayed.

Name	Oracle Database Type	Host/Cluster	Resource Group	Policies	Last Backup	Overall Status
cdb2	Single Instance (Multitenant)	rhel2.demo.netapp.com				Not protected

When the database is initially discovered, the Overall Status is shown as "Not protected." The previous screenshot shows an Oracle database not protected yet by a backup policy.

When a backup configuration or policy is set up and a backup has been executed, the Overall Status for the database shows the backup status as "Backup succeeded" and the timestamp of the last backup. The following screenshot shows the backup status of a SQL Server user database.

Name	Instance	Host	Last Backup	Overall Status	Type
master	sql1	sql1.demo.netapp.com		Not available for backup	System database
model	sql1	sql1.demo.netapp.com		Not available for backup	System database
msdb	sql1	sql1.demo.netapp.com		Not available for backup	System database
tempdb	sql1	sql1.demo.netapp.com		Not available for backup	System database
tpcc	sql1	sql1.demo.netapp.com	09/14/2021 2:35:07 PM	Backup succeeded	User database

If database access credentials are not properly set up, a red lock button indicates that the database is not accessible. For example, if Windows credentials do not have sysadmin access to a database instance, then database credentials must be reconfigured to unlock the red lock.

Name	Host	Resource Groups	Policies	State	Type
sql-standby	sql-standby.demo.netapp.com			Running	Standalone ()
sql1	sql1.demo.netapp.com			Running	Standalone (15.0.2000)

The Microsoft SQL Server or Windows credentials are necessary to unlock the selected instance. Click Refresh Resources to run a discovery with the associated Auth.

Name	Host	Resource Groups	Policies	State	Type
sql-standby	sql-standby.demo.netapp.com	None	None	Not available for backup. DB is not on NetApp storage, auto-close is enabled or in recovery mode.	Standalone ()
sql1	sql1.demo.netapp.com				Standalone (15.0.2000)

After the appropriate credentials are configured either at the Windows level or the database level, the red lock disappears and SQL Server Type information is gathered and reviewed.

Name	Host	Resource Groups	Policies	State	Type
sql1	sql1.demo.netapp.com			Running	Standalone (15.0.2000)
sql-standby	sql-standby.demo.netapp.com			Running	Standalone (15.0.2000)

## 5. Setup storage cluster peering and DB volumes replication

To protect your on-premises database data using a public cloud as the target destination, on-premises ONTAP cluster database volumes are replicated to the cloud CVO using NetApp SnapMirror technology. The replicated target volumes can then be cloned for DEV/OPS or disaster recovery. The following high-level steps enable you to set up cluster peering and DB volumes replication.

1. Configure intercluster LIFs for cluster peering on both the on-premises cluster and the CVO cluster instance. This step can be performed with ONTAP System Manager. A default CVO deployment has inter-cluster LIFs configured automatically.

On-premises cluster:

Name	Status	Storage VM	IPspace	Address	Current Node	Current Port	Protocols	Type
onPrem-01_IC	Green		Default	192.168.0.113	onPrem-01	e0b		Intercluster
onPrem-01_mgmt1	Green		Default	192.168.0.111	onPrem-01	e0c		Cluster/Node Mgmt
cluster_mgmt	Green		Default	192.168.0.101	onPrem-01	e0a		Cluster/Node Mgmt

Target CVO cluster:

Name	Status	Storage VM	IPspace	Address	Current Node	Current Port	Protocols	Type	Throughput (I)
hybridcvo-02_mgmt1	Green		Default	10.221.2.104	hybridcvo-02	e0a		Cluster/Node Mgmt	0
inter_1	Green		Default	10.221.1.180	hybridcvo-01	e0a		Intercluster,Cluster/Node Mgmt	0.02
inter_2	Green		Default	10.221.2.250	hybridcvo-02	e0a		Intercluster,Cluster/Node Mgmt	0.03
iscsi_1	Green	svm_hybridcvo	Default	10.221.1.5	hybridcvo-01	e0a	iSCSI	Data	0
iscsi_2	Green	svm_hybridcvo	Default	10.221.2.168	hybridcvo-02	e0a	iSCSI	Data	0

2. With the intercluster LIFs configured, cluster peering and volume replication can be set up by using drag-and-drop in NetApp Cloud Manager. See "[Getting Started - AWS Public Cloud](#)" for details.

Alternatively, cluster peering and DB volume replication can be performed by using ONTAP System Manager as follows:

3. Log into ONTAP System Manager. Navigate to Cluster > Settings and click Peer Cluster to set up cluster peering with the CVO instance in the cloud.

The screenshot shows the ONTAP System Manager interface. The left sidebar is collapsed. The main area has a header "ONTAP System Manager" with a link to "Return to classic version". A search bar at the top right says "Search actions, objects, and pages".

- UI Settings:** LOG LEVEL is set to DEBUG. INACTIVITY TIMEOUT is set to 30 minutes.
- Intercluster Settings:**
  - Network Interfaces:** IP ADDRESS is 192.168.0.113.
  - Cluster Peers:** PEERED CLUSTER NAME is hybridcvo. A context menu is open over this section, with the "Peer Cluster" option highlighted with a red box.
  - Storage VM Peers:** PEERED STORAGE VMS is 1.

4. Go to the Volumes tab. Select the database volume to be replicated and click Protect.

The screenshot shows the ONTAP System Manager interface with the Volumes tab selected in the left sidebar. The main area displays a list of volumes and detailed information for a selected volume.

- Volumes List:** The "Protect" button is highlighted with a red box.
- Selected Volume Details:**
  - rhel2\_u03** (All Volumes)
  - Overview** tab is active.
  - Capacity:** Snapshot Capacity: 0 Bytes Available | 2.36 GB Used | 2.36 GB Overflow.
  - Performance:** Latency chart showing values for Hour, Day, and Week.

5. Set the protection policy to Asynchronous. Select the destination cluster and storage SVM.

The screenshot shows the 'Protect Volumes' dialog in the ONTAP System Manager. The 'PROTECTION POLICY' dropdown is set to 'Asynchronous'. Under 'Source', 'CLUSTER' is 'onPrem' and 'SELECTED VOLUMES' is 'rhel2\_u03'. Under 'Destination', 'CLUSTER' is 'hybridcvo' and 'STORAGE VM' is 'svm\_hybridcvo'. In the 'Destination Settings' section, there are two matching labels. The 'VOLUME NAME' field has a prefix 'vol\_' and a suffix '\_dest'. Under 'Configuration Details', the 'Initialize relationship' checkbox is checked, while 'Enable FabricPool' is unchecked.

- Validate that the volume is synced between the source and target and that the replication relationship is healthy.

Source	Destination	Protection Policy	Relationship Health	Relationship Status	Lag
svm_onPrem:rhel2_u03	svm_hybridcvo:rhel2_u03_dr	MirrorAllSnapshots	<span style="color: green;">Healthy</span>	<span style="color: green;">Mirrored</span>	12 seconds

## 6. Add CVO database storage SVM to SnapCenter

- Log into SnapCenter with a user ID with SnapCenterAdmin privileges.
- Click the Storage System tab from the menu, and then click New to add a CVO storage SVM that hosts replicated target database volumes to SnapCenter. Enter the cluster management IP in the Storage System field, and enter the appropriate username and password.

3. Click More Options to open additional storage configuration options. In the Platform field, select Cloud Volumes ONTAP, check Secondary, and then click Save.

Platform	Cloud Volumes ON <sup>TM</sup>	<input checked="" type="checkbox"/> Secondary
Protocol	HTTPS	
Port	443	
Timeout	60	seconds
<input type="checkbox"/> Preferred IP		

4. Assign the storage systems to SnapCenter database management user IDs as shown in [3. SnapCenter host plugin installation](#).

Name	IP	Cluster Name	User Name	Platform	Controller License
svm_hybridcvo	10.0.0.1			CVO	<span style="color:red;">*</span>
svm_onPrem	192.168.0.101			CVO	<span style="color:green;">✓</span>

## 7. Setup database backup policy in SnapCenter

The following procedures demonstrates how to create a full database or log file backup policy. The policy can then be implemented to protect databases resources. The recovery point objective (RPO) or recovery time objective (RTO) dictates the frequency of database and/or log backups.

## Create a full database backup policy for Oracle

1. Log into SnapCenter as a database management user ID, click Settings, and then click Policies.

The screenshot shows the NetApp SnapCenter interface. The left sidebar has links for Dashboard, Resources, Monitor, Reports, Hosts, Storage Systems, Settings (which is selected), and Alerts. The main area is titled 'Policies' and shows 'Oracle Database'. A search bar says 'Search by Name'. Below it is a table with columns: Name, Backup Type, Schedule Type, Replication, and Verification. Two rows are listed: 'Oracle Archive Log Backup' (LOG, ONLINE, Hourly, SnapMirror) and 'Oracle Full Online Backup' (FULL, ONLINE, Daily, SnapMirror). Action buttons at the top right include 'New', 'Modify', 'Copy', 'Details', and 'Delete'.

2. Click New to launch a new backup policy creation workflow or choose an existing policy for modification.

The screenshot shows the 'Modify Oracle Database Backup Policy' dialog. On the left is a vertical navigation bar with steps 1 through 7. Step 1, 'Name', is selected and highlighted in blue. The main area is titled 'Provide a policy name'. It contains two fields: 'Policy name' with the value 'Oracle Full Online Backup' and 'Details' with the value 'Backup all data and log files'. At the bottom right are 'Previous' and 'Next' buttons, with 'Next' being the active button.

3. Select the backup type and schedule frequency.

## 8. Implement backup policy to protect database

SnapCenter uses a resource group to backup a database in a logical grouping of database resources, such as multiple databases hosted on a server, a database sharing the same storage volumes, multiple databases supporting a business application, and so on. Protecting a single database creates a resource group of its own. The following procedures demonstrate how to implement a backup policy created in section 7 to protect Oracle and SQL Server databases.

### Create a resource group for full backup of Oracle

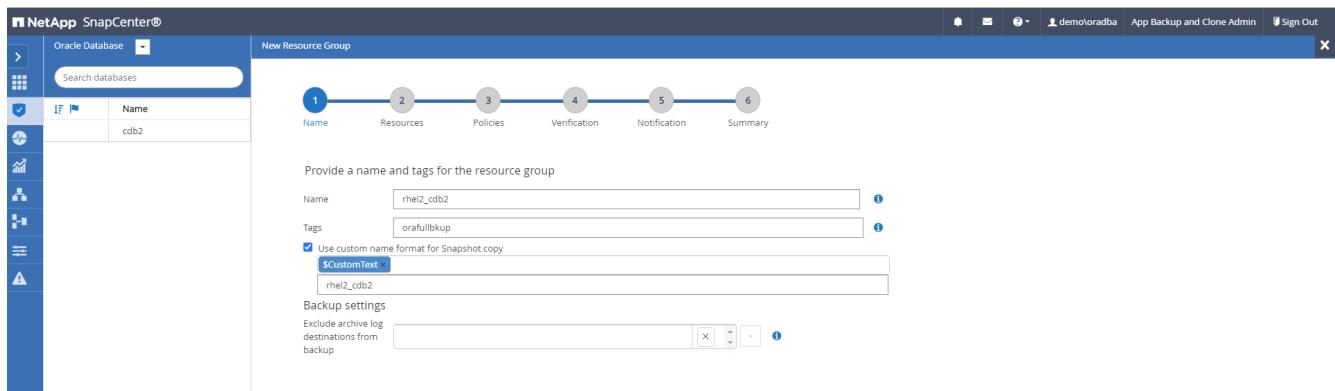

1. Log into SnapCenter with a database management user ID, and navigate to the Resources tab. In the View drop-down list, choose either Database or Resource Group to launch the resource group creation workflow.

The screenshot shows the NetApp SnapCenter interface. The top navigation bar includes links for Dashboard, Oracle Database, demotoradb, App Backup and Clone Admin, and Sign Out. The left sidebar has links for Resources, Monitor, Reports, Hosts, Storage Systems, Settings, and Alerts. The main content area is titled "Oracle Database" and shows a table with one row:

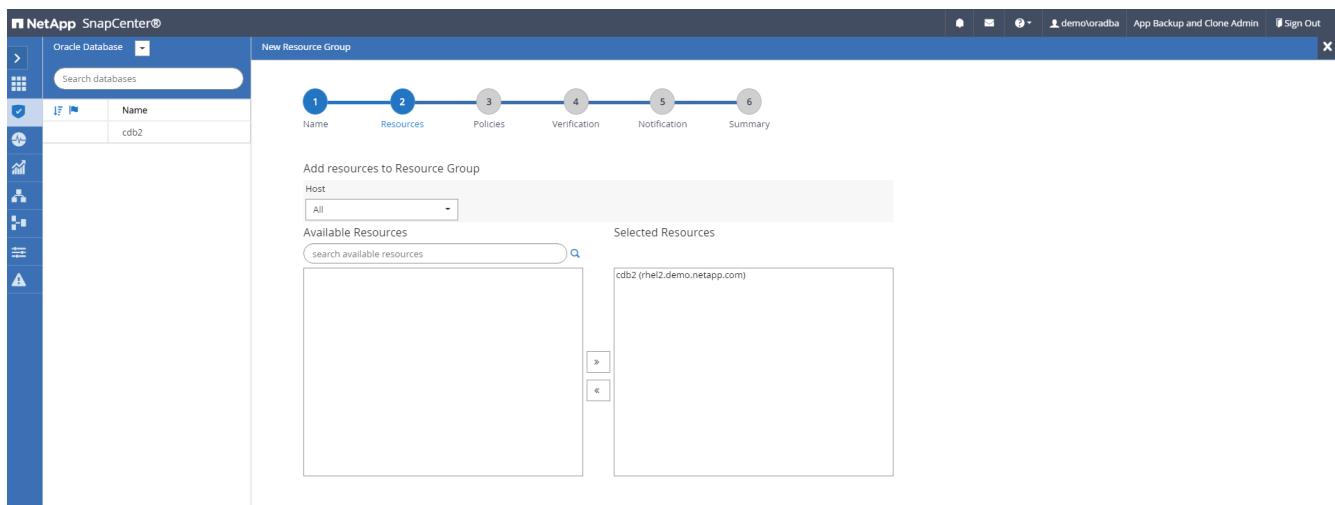

Name	Oracle Database Type	Host/Cluster	Resource Group	Policies	Last Backup	Overall Status
cdb2	Single Instance (Multitenant)	rhel2.demo.netapp.com				Not protected

Buttons at the bottom right include Refresh Resources and New Resource Group.

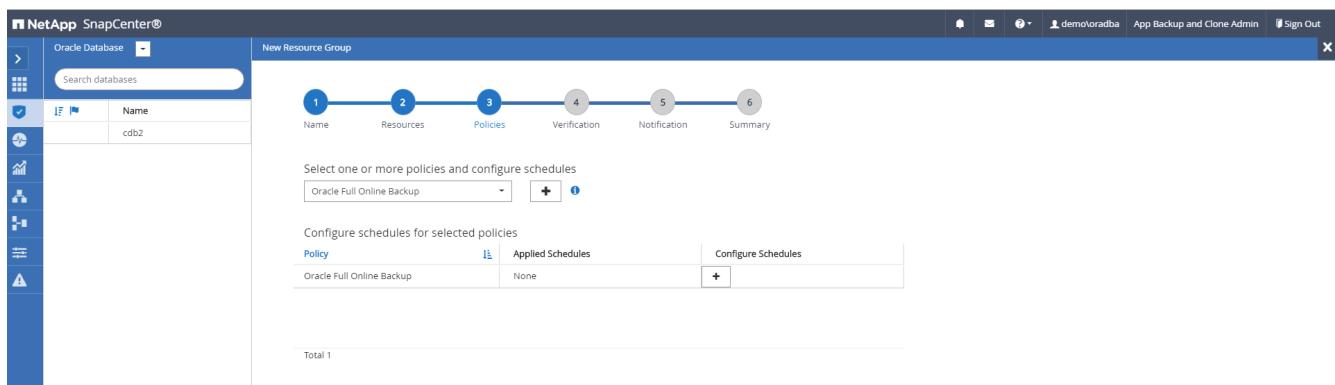

2. Provide a name and tags for the resource group. You can define a naming format for the Snapshot copy and bypass the redundant archive log destination if configured.

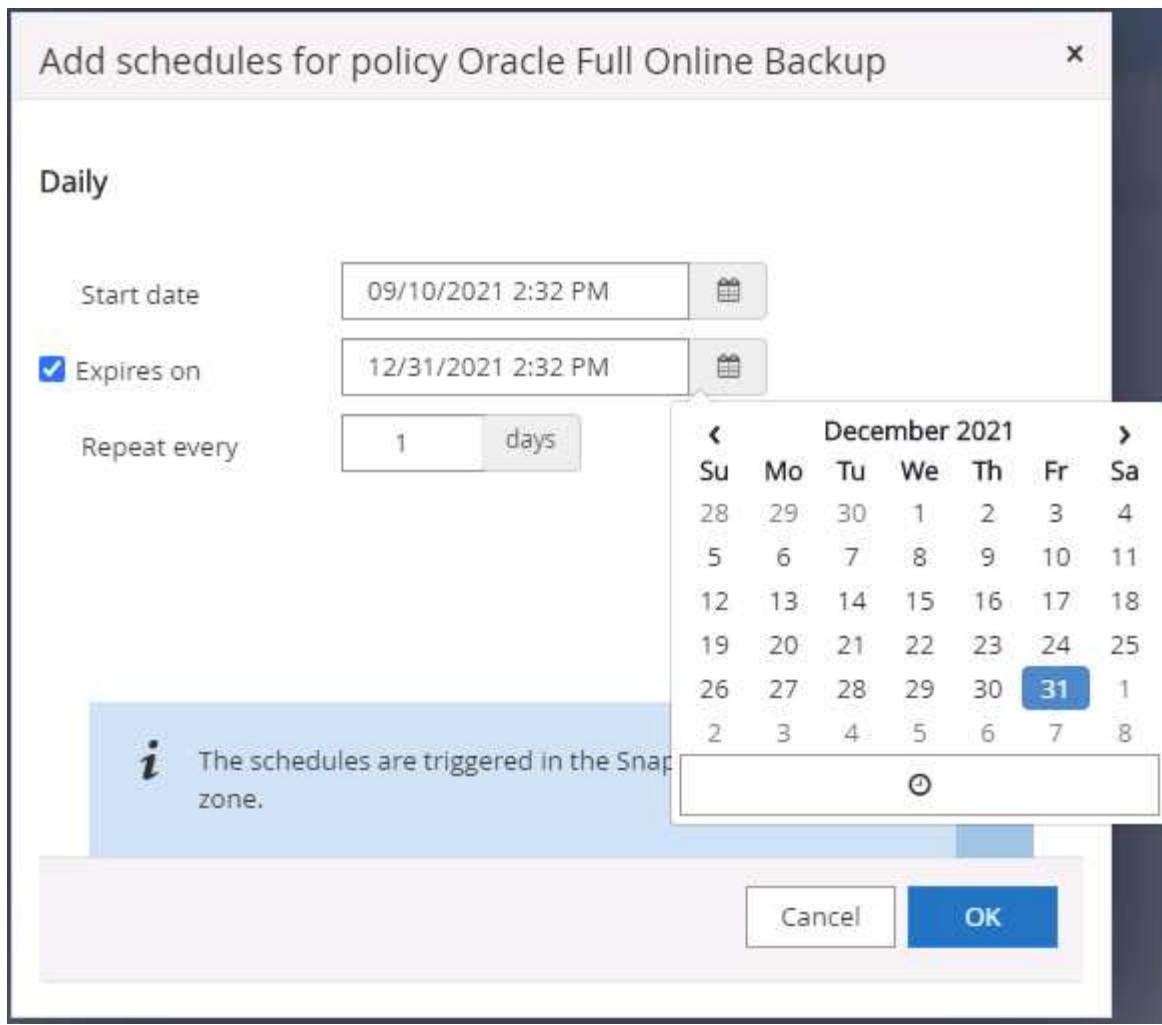

### 3. Add database resources to the resource group.

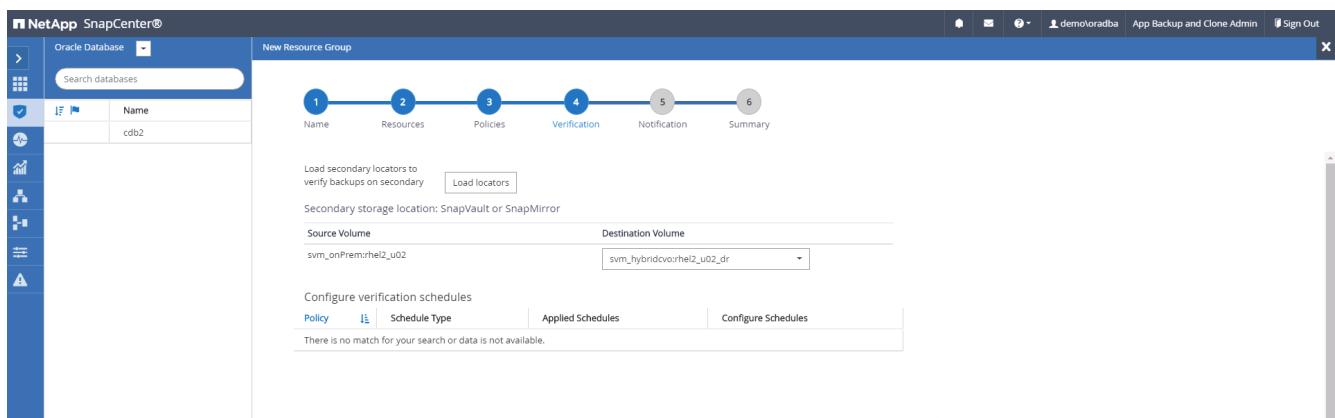

### 4. Select a full backup policy created in section 7 from the drop-down list.

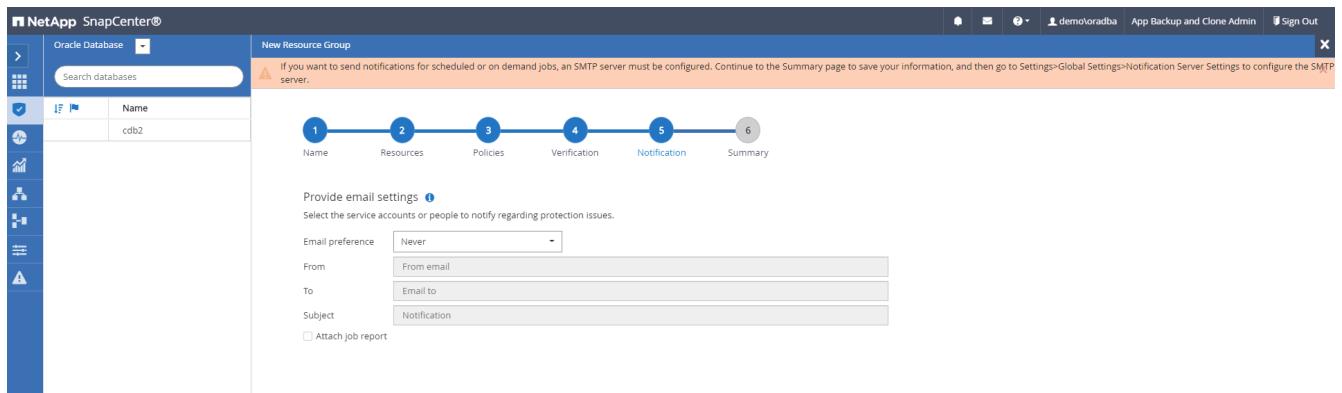

### 5. Click the (+) sign to configure the desired backup schedule.

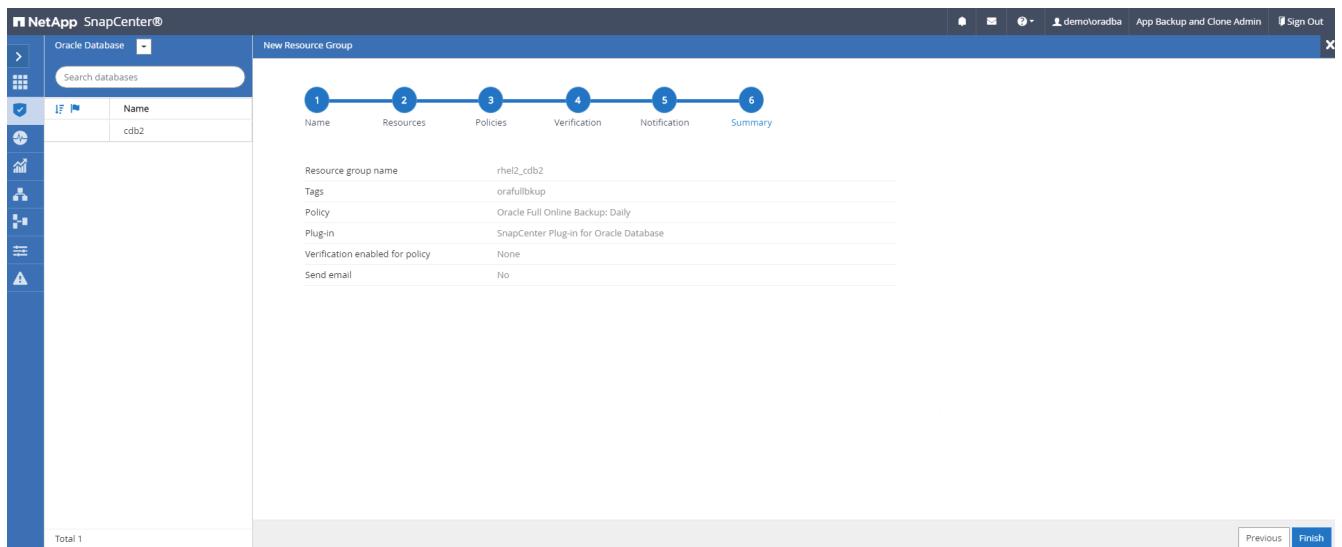

6. Click Load Locators to load the source and destination volume.

7. Configure the SMTP server for email notification if desired.

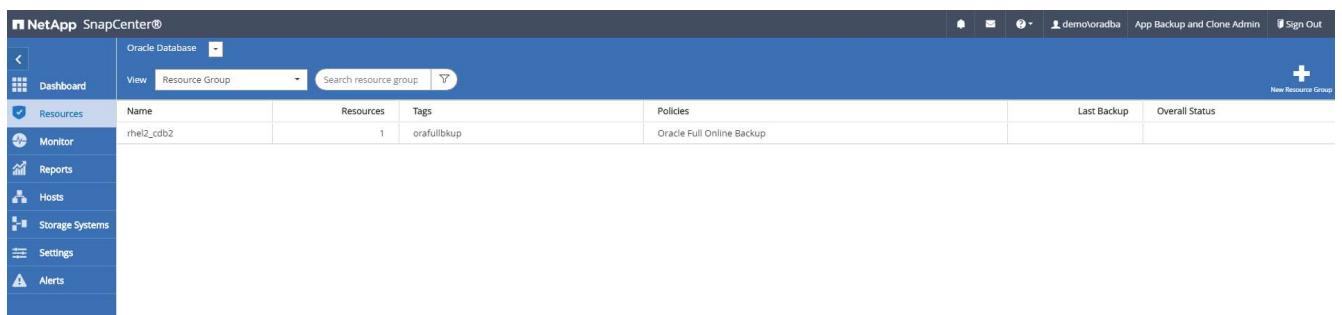

## 8. Summary.

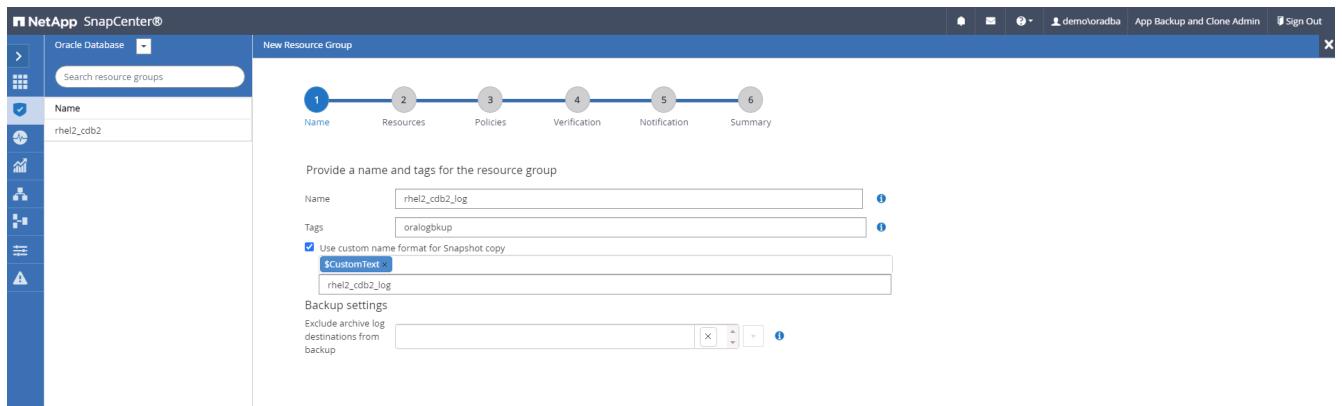

## Create a resource group for log backup of Oracle

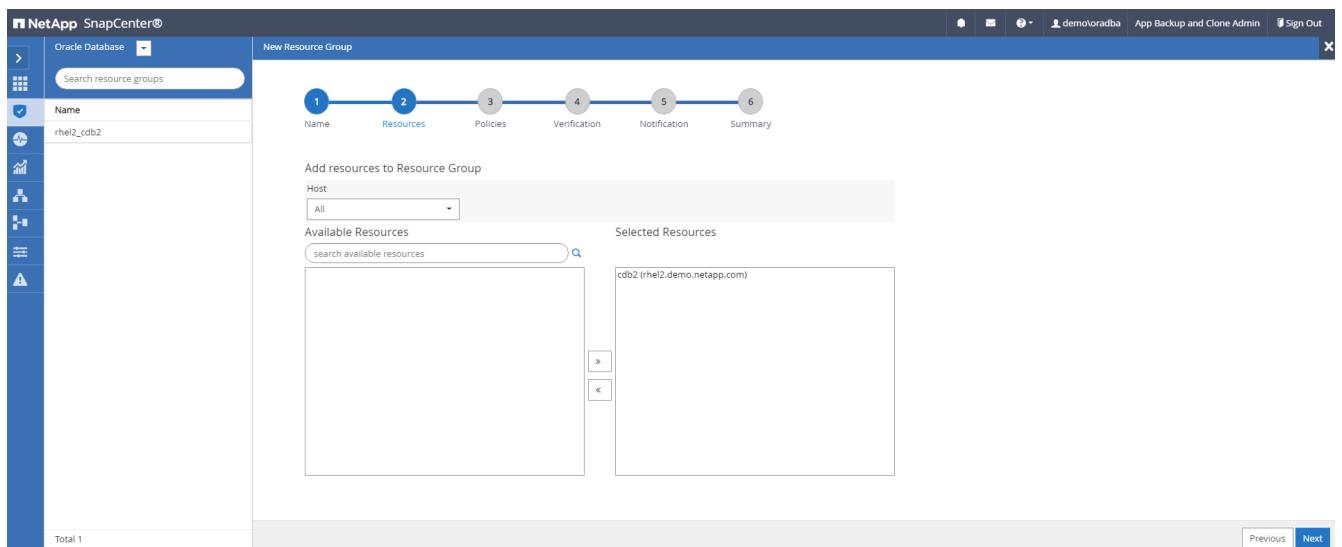

1. Log into SnapCenter with a database management user ID, and navigate to the Resources tab. In the View drop-down list, choose either Database or Resource Group to launch the resource group creation workflow.

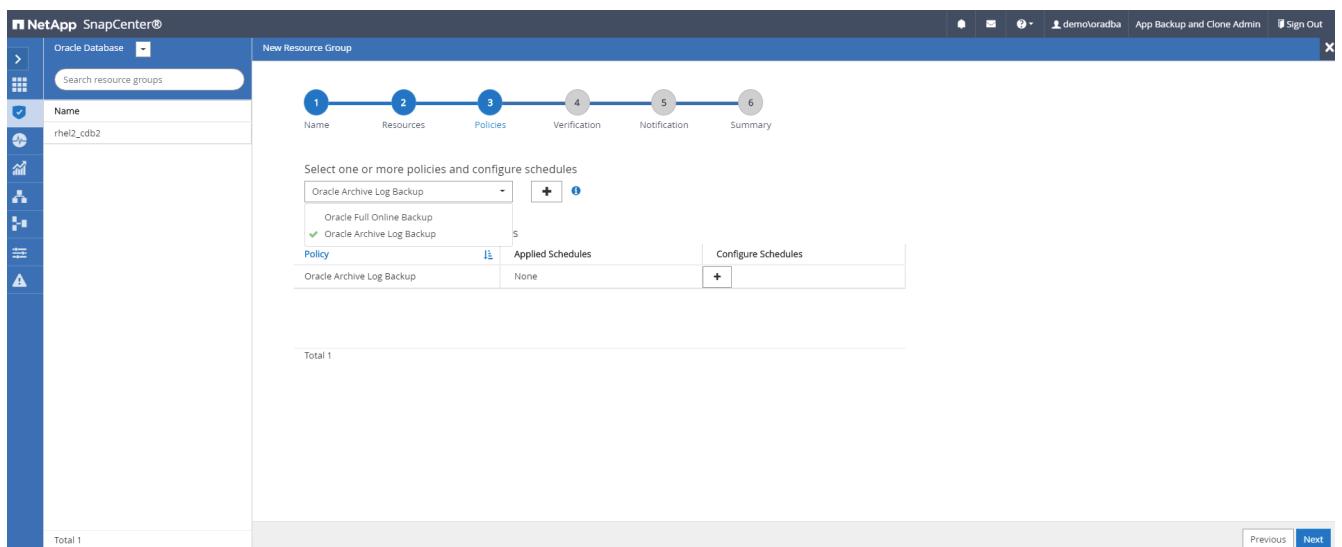

2. Provide a name and tags for the resource group. You can define a naming format for the Snapshot copy and bypass the redundant archive log destination if configured.

3. Add database resources to the resource group.

4. Select a log backup policy created in section 7 from the drop-down list.

5. Click on the (+) sign to configure the desired backup schedule.

Add schedules for policy Oracle Archive Log Backup x

7. Configure an SMTP server for email notification if desired.

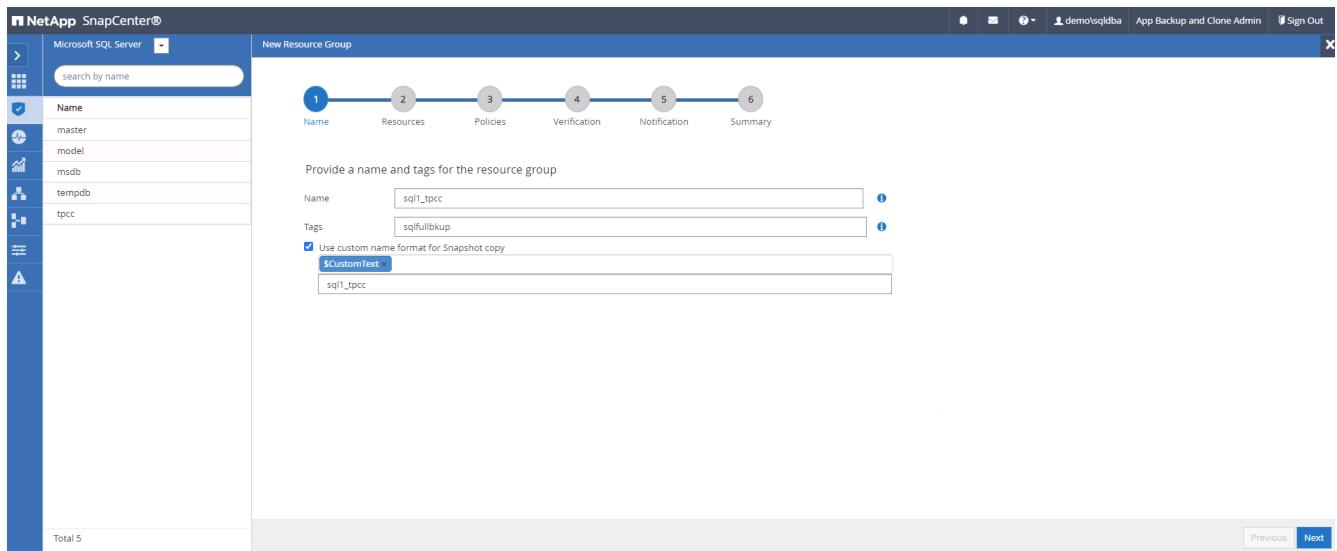

## 8. Summary.

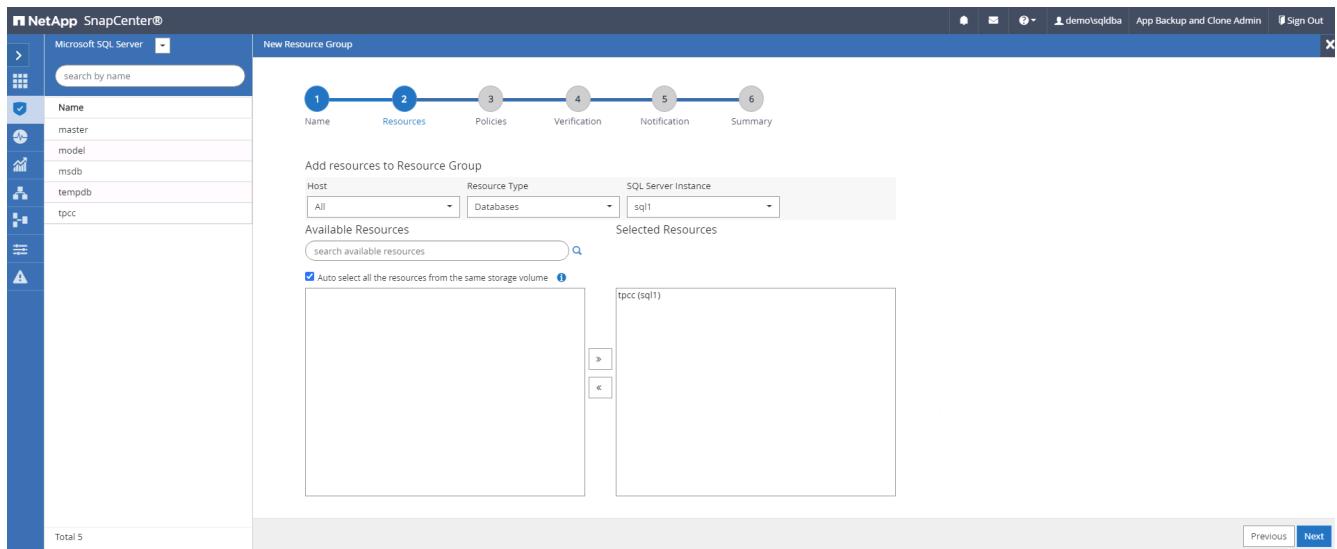

## Create a resource group for full backup of SQL Server

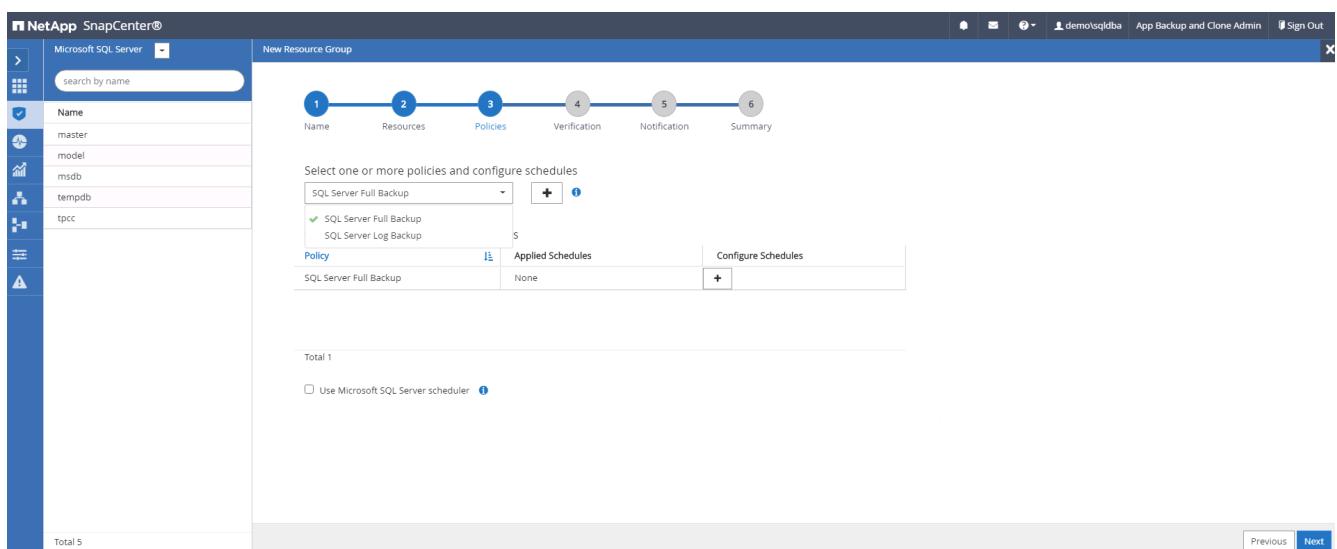

1. Log into SnapCenter with a database management user ID, and navigate to the Resources tab. In the View drop-down list, choose either a Database or Resource Group to launch the resource group creation workflow. Provide a name and tags for the resource group. You can define a naming format for the Snapshot copy.

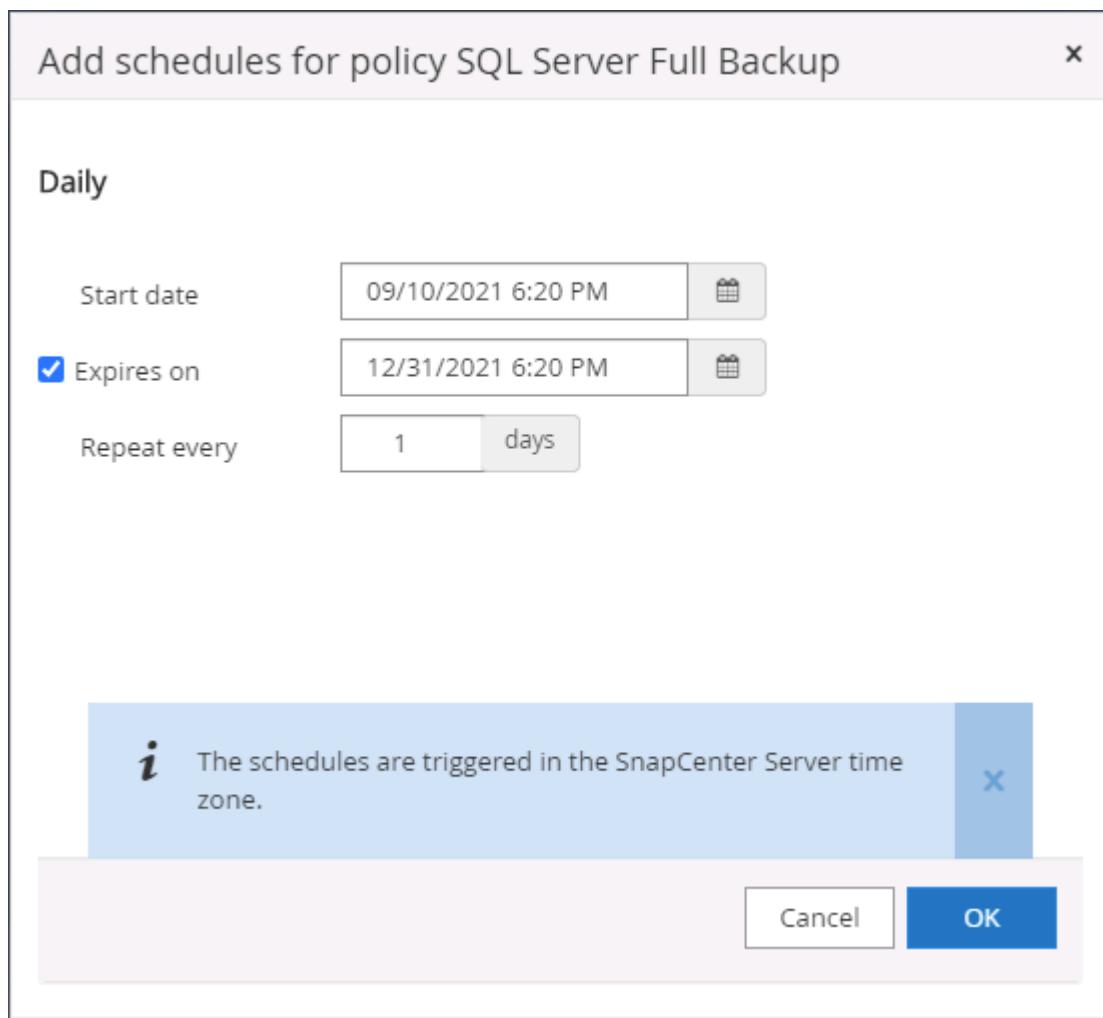

## 2. Select the database resources to be backed up.

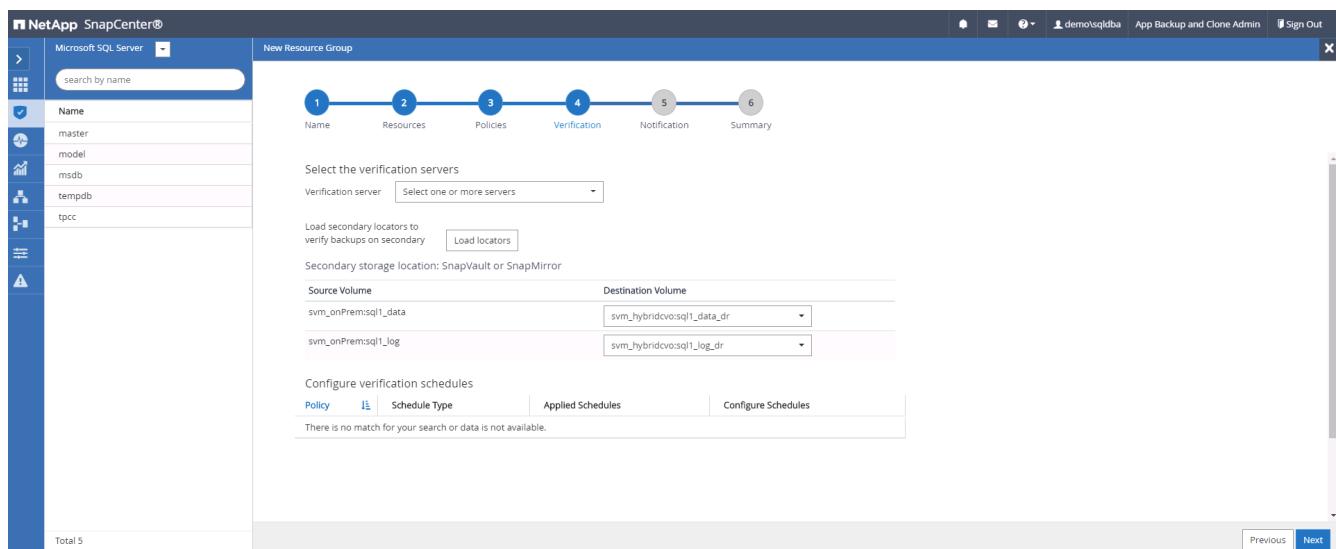

## 3. Select a full SQL backup policy created in section 7.

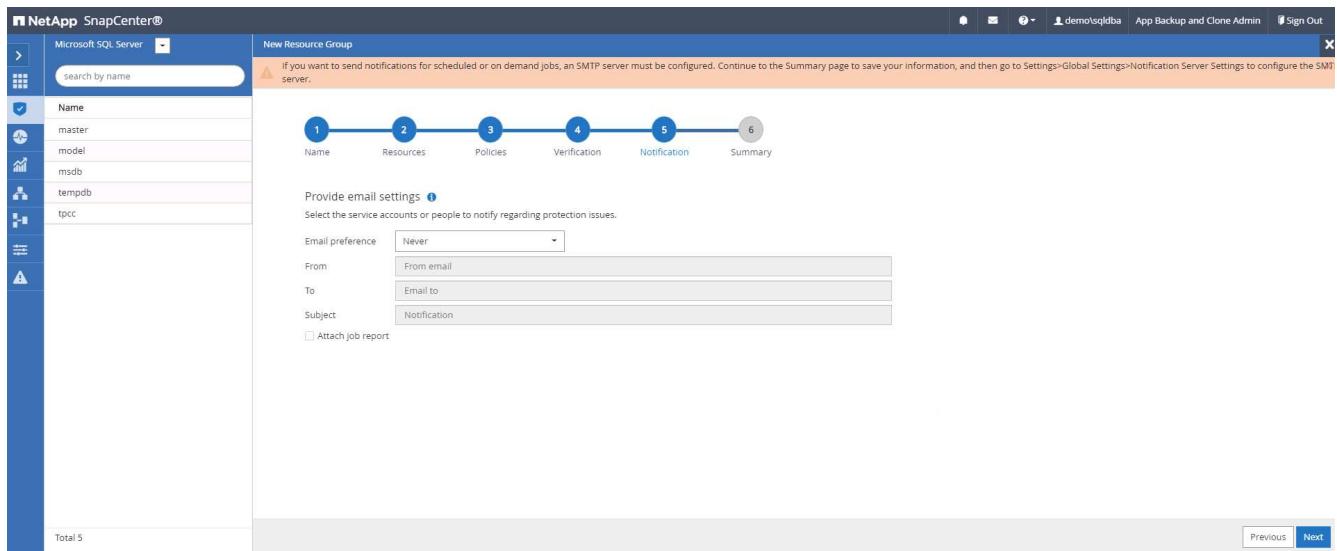

- Add exact timing for backups as well as the frequency.

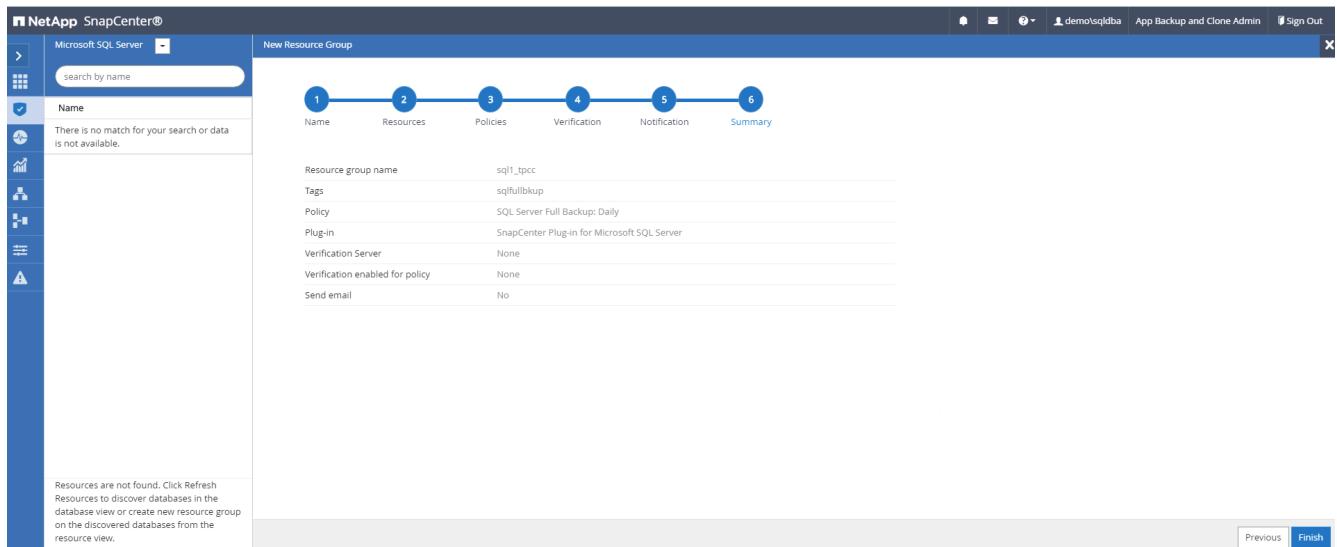

- Choose the verification server for the backup on secondary if backup verification is to be performed. Click Load Locator to populate the secondary storage location.

- Configure the SMTP server for email notification if desired.

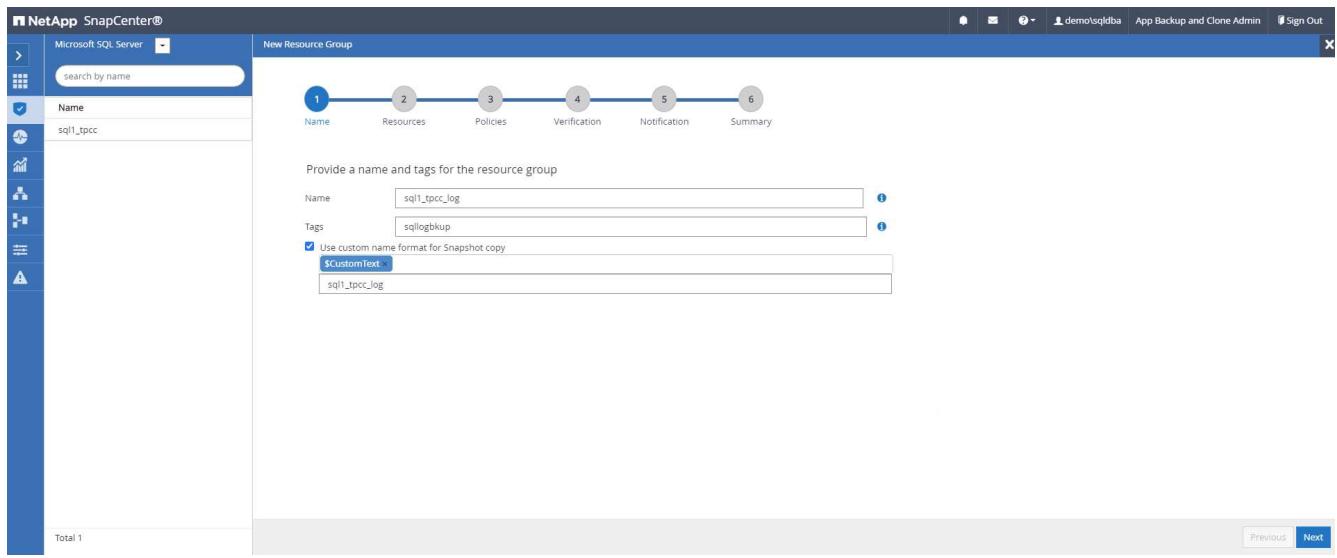

## 7. Summary.

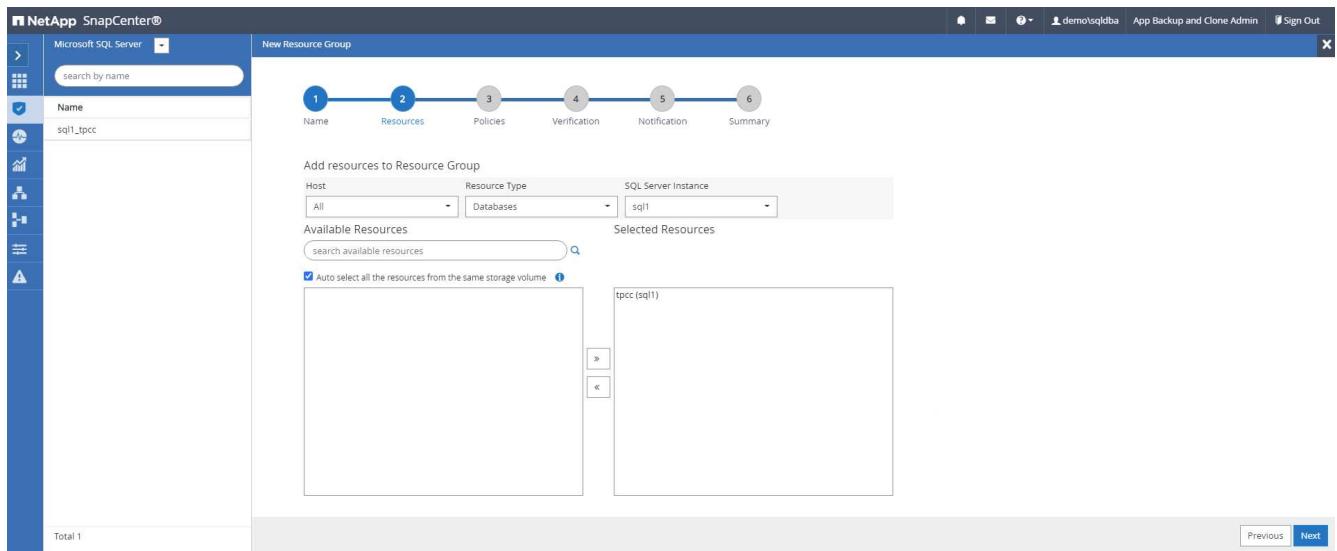

## Create a resource group for log backup of SQL Server

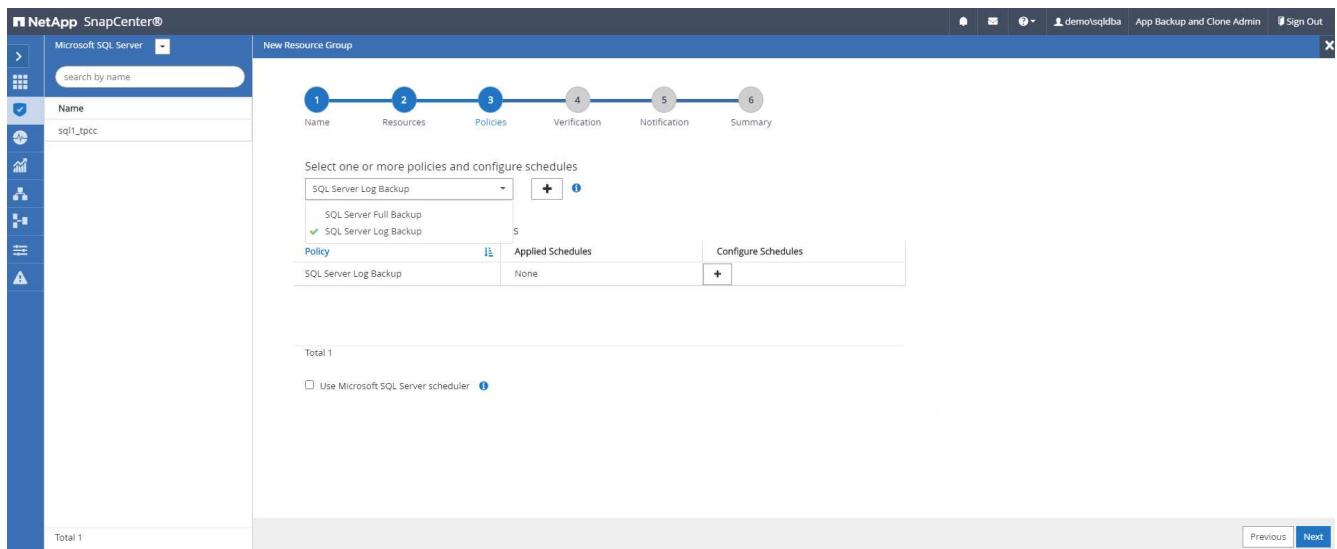

1. Log into SnapCenter with a database management user ID, and navigate to the Resources tab. In the View drop-down list, choose either a Database or Resource Group to launch the resource group creation workflow. Provide the name and tags for the resource group. You can define a naming format for the Snapshot copy.

2. Select the database resources to be backed up.

3. Select a SQL log backup policy created in section 7.

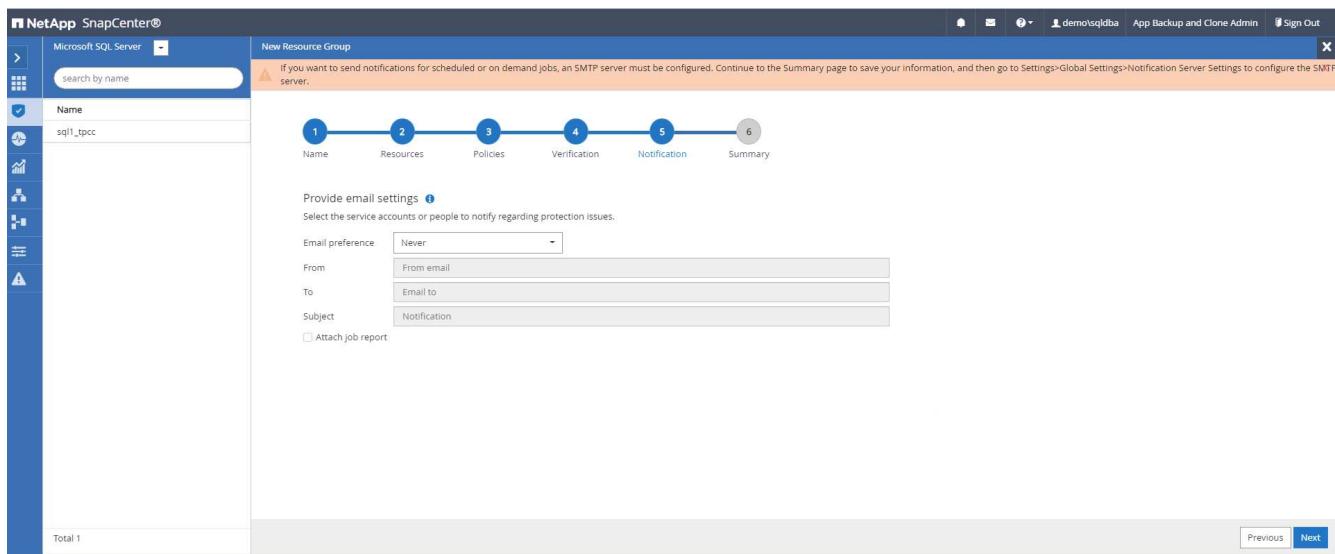

4. Add exact timing for the backup as well as the frequency.

The screenshot shows the 'New Resource Group' wizard in NetApp SnapCenter. The current step is 'Policies'. A table lists a single policy: 'SQL Server Log Backup' with an applied schedule of 'Hourly: Repeat every 1 hours'. There is also an option to 'Configure Schedules'. The navigation bar at the top includes tabs for Name, Resources, Policies, Verification, Notification, and Summary. On the left, there's a sidebar with various icons and a search bar.

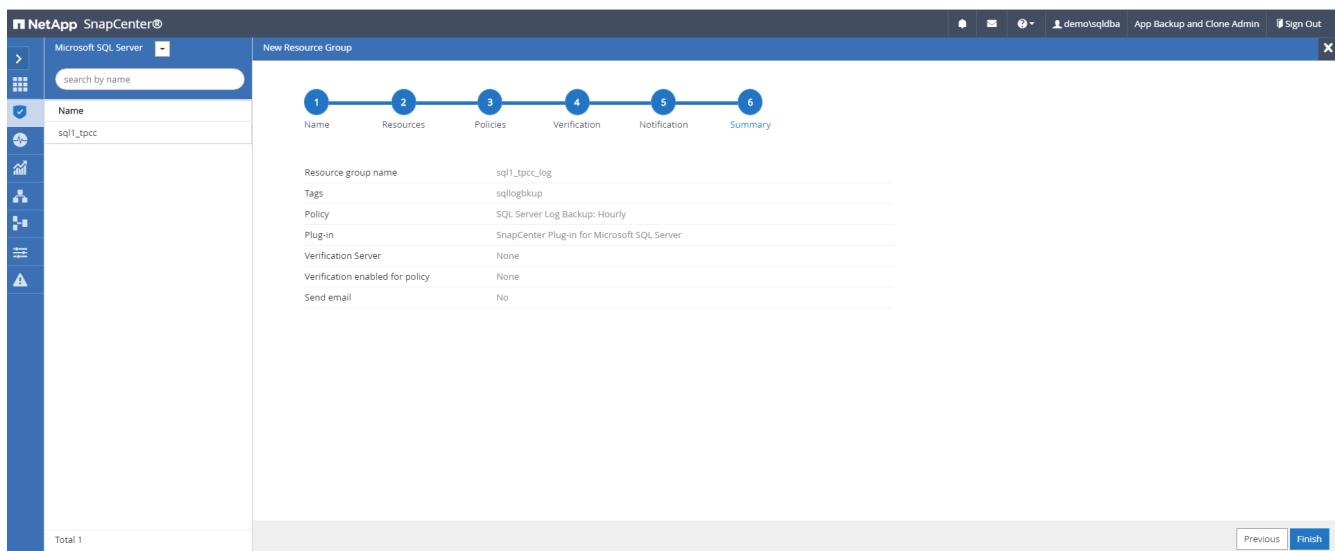

5. Choose the verification server for the backup on secondary if backup verification is to be performed. Click the Load Locator to populate the secondary storage location.

The screenshot shows the 'Verification' step of the 'New Resource Group' wizard. It allows selecting verification servers and configuring verification schedules. The 'Source Volume' and 'Destination Volume' fields are filled with specific volume names. The 'Configure verification schedules' section shows a message: 'There is no match for your search or data is not available.' The navigation bar and sidebar are similar to the previous screenshot.

6. Configure the SMTP server for email notification if desired.

## 7. Summary.

## 9. Validate backup

After database backup resource groups are created to protect database resources, the backup jobs runs according to the predefined schedule. Check the job execution status under the Monitor tab.

Jobs							
Dashboard		Jobs - Filter		Logs			
	ID	Status	Name		Start date	End date	Owner
Reports	532	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		09/14/2021 8:35:01 PM	09/14/2021 8:37:10 PM	demo\sqldba
Hosts	528	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		09/14/2021 7:35:01 PM	09/14/2021 7:37:09 PM	demo\sqldba

	509	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		09/14/2021 3:35:01 PM	09/14/2021 3:37:09 PM	demo\sqldba
	503	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		09/14/2021 2:35:01 PM	09/14/2021 2:37:09 PM	demo\sqldba

Go to the Resources tab, click the database name to view details of database backup, and toggle between Local copies and mirror copies to verify that Snapshot backups are replicated to a secondary location in the

public cloud.

The screenshot shows the NetApp SnapCenter interface for Oracle Database management. On the left, a sidebar lists databases: cdb2, cdb2dev, cdb2dr, cdb2dr2, and cdb2test. The main panel displays 'cdb2 Topology' with a summary card showing 394 Backups, 28 Data Backups, 366 Log Backups, and 3 Clones. It also shows 'Manage Copies' for 'Local copies' (197 Backups, 0 Clones) and 'Mirror copies' (197 Backups, 3 Clones). Below this is a table titled 'Primary Backup(s)' listing five backups with details like Count, Type, End Date, Verified, Mounted, RMAN Cataloged, and SCN.

Backup Name	Count	Type	End Date	Verified	Mounted	RMAN Cataloged	SCN
rhel2_cdb2_09-23-2021_14.35.03.3242_1	1	Log	09/23/2021 2:35:45 PM	Not Applicable	False	Not Cataloged	6872761
rhel2_cdb2_09-23-2021_14.35.03.3242_0	1	Data	09/23/2021 2:35:30 PM	Unverified	False	Not Cataloged	6872715
rhel2_cdb2_09-22-2021_14.35.02.0014_1	1	Log	09/22/2021 2:35:24 PM	Not Applicable	False	Not Cataloged	6737479
rhel2_cdb2_09-22-2021_14.35.02.0014_0	1	Data	09/22/2021 2:35:14 PM	Unverified	False	Not Cataloged	6737395
rhel2_cdb2_09-21-2021_14.35.02.1884_1	1	Log	09/21/2021 2:35:35 PM	Not Available	False	Not Cataloged	6598735

At this point, database backup copies in the cloud are ready to clone to run dev/test processes or for disaster recovery in the event of a primary failure.

Next: [Getting Started with AWS public cloud](#).

## Getting Started with AWS public cloud

Previous: [Getting started on-premises](#).

### AWS public cloud

To make things easier to follow, we have created this document based on a deployment in AWS. However, the process is very similar for Azure and GCP.

#### 1. Pre-flight check

Before deployment, make sure that the infrastructure is in place to allow for the deployment in the next stage. This includes the following:

- AWS account
- VPC in your region of choice
- Subnet with access to the public internet
- Permissions to add IAM roles into your AWS account
- A secret key and access key for your AWS user

#### 2. Steps to deploy Cloud Manager and Cloud Volumes ONTAP in AWS

There are many methods for deploying Cloud Manager and Cloud Volumes ONTAP; this method is the simplest but requires the most permissions. If this method is not appropriate for your AWS environment, please consult the [NetApp Cloud Documentation](#).

#### Deploy the Cloud Manager connector

1. Navigate to [NetApp Cloud Central](#) and log in or sign up.

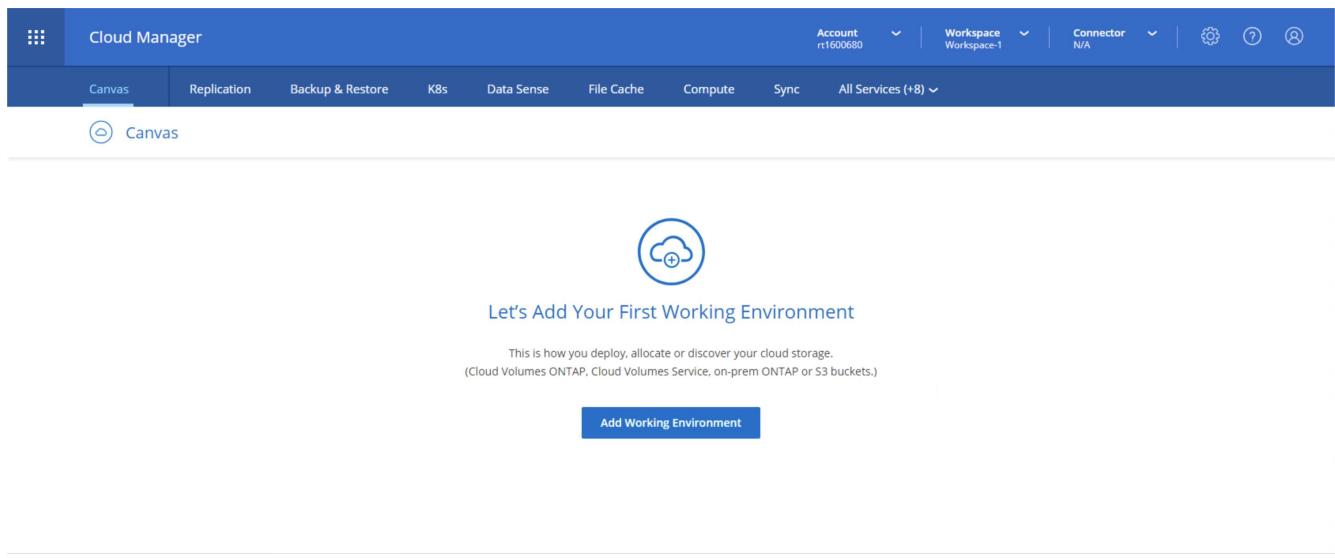

[Continue to Cloud Manager](#)

## Log In to NetApp Cloud Central

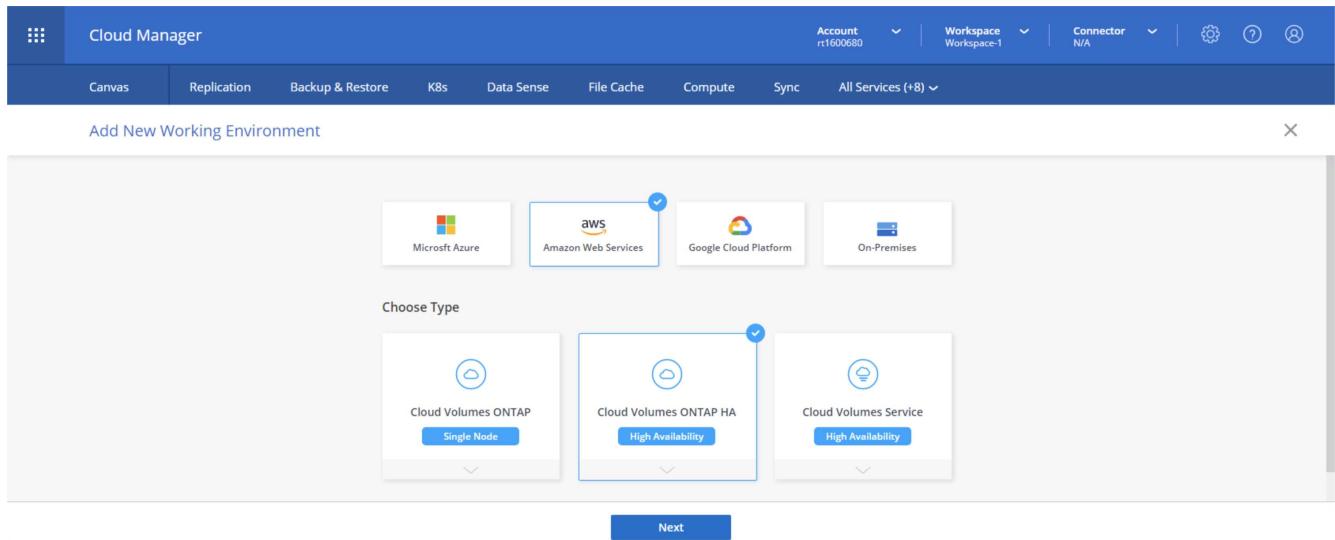

Don't have an account yet? [Sign Up](#)

[Forgot your password?](#)

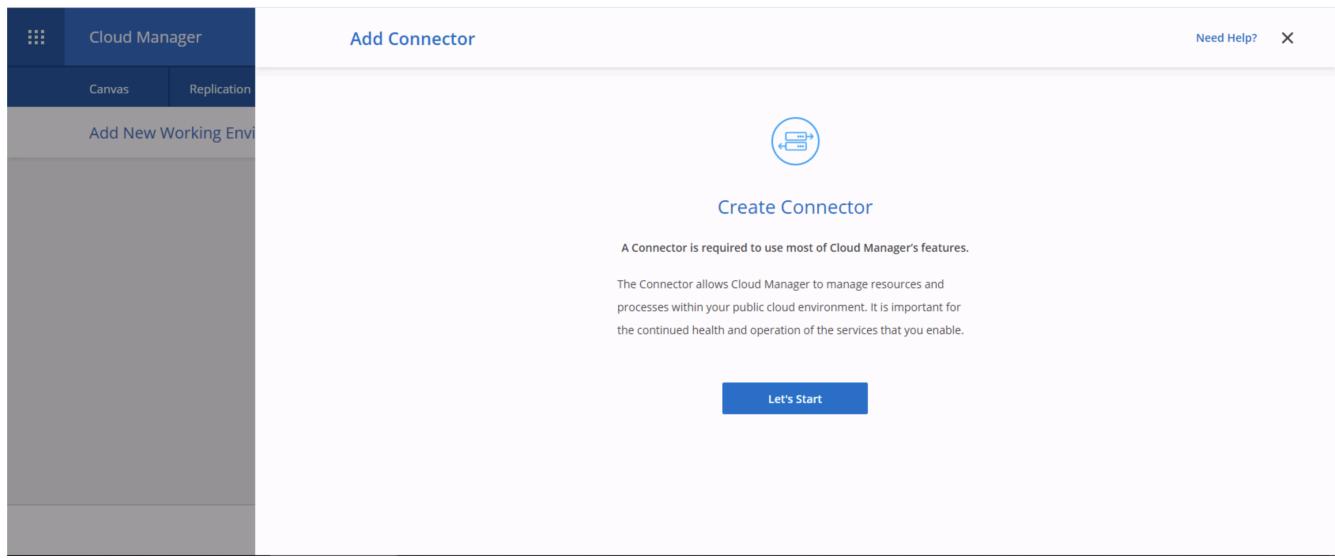

2. After you log in, you should be taken to the Canvas.

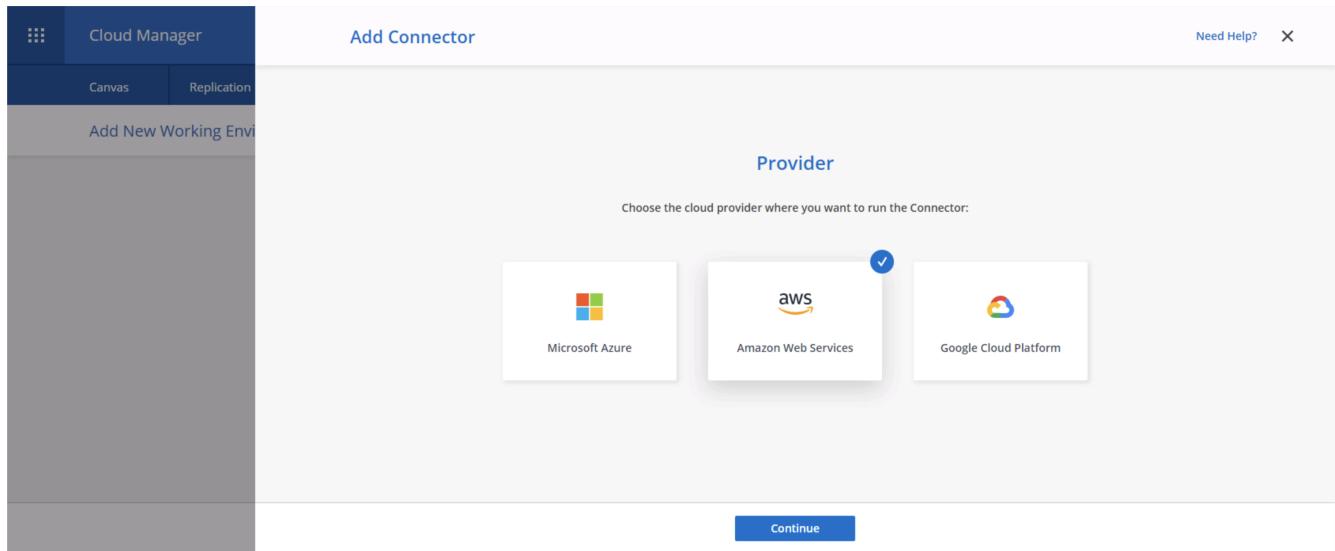

3. Click "Add Working Environment" and choose Cloud Volumes ONTAP in AWS. Here, you also choose whether you want to deploy a single node system or a high availability pair. I have chosen to deploy a high availability pair.

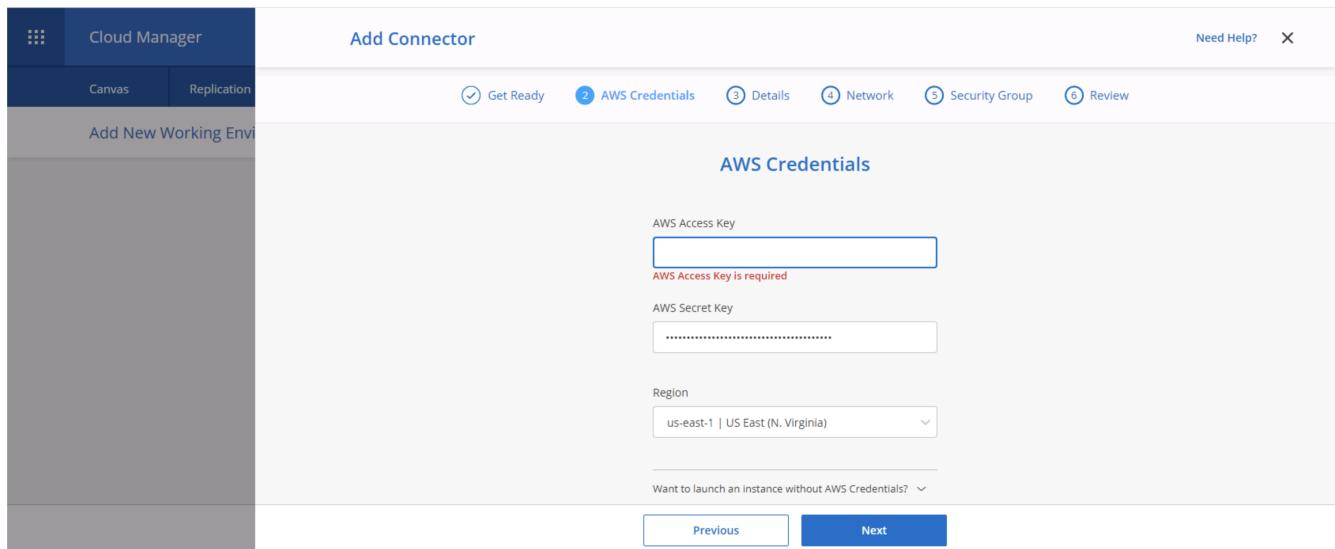

4. If no connector has been created, a pop-up appears asking you to create a connector.

5. Click Lets Start, and then choose AWS.

6. Enter your secret key and access key. Make sure that your user has the correct permissions outlined on the [NetApp policies page](#).

7. Give the connector a name and either use a predefined role as described on the [NetApp policies page](#) or ask Cloud Manager to create the role for you.

Cloud Manager

Add Connector

Get Ready AWS Credentials Details Network Security Group Review

Connector Instance Name: awscloudmanager

Connector Role:

- Create Role
- Select an existing Role

Role Name: Cloud-Manager-Operator-IBNt24

Add Tags to Connector Instance

Previous Next

8. Give the networking information needed to deploy the connector. Verify that outbound internet access is enabled by:
- Giving the connector a public IP address
  - Giving the connector a proxy to work through
  - Giving the connector a route to the public internet through an Internet Gateway

Cloud Manager

Add Connector

9. Provide communication with the connector via SSH, HTTP, and HTTPS by either providing a security group or creating a new security group. I have enabled access to the connector from my IP address only.

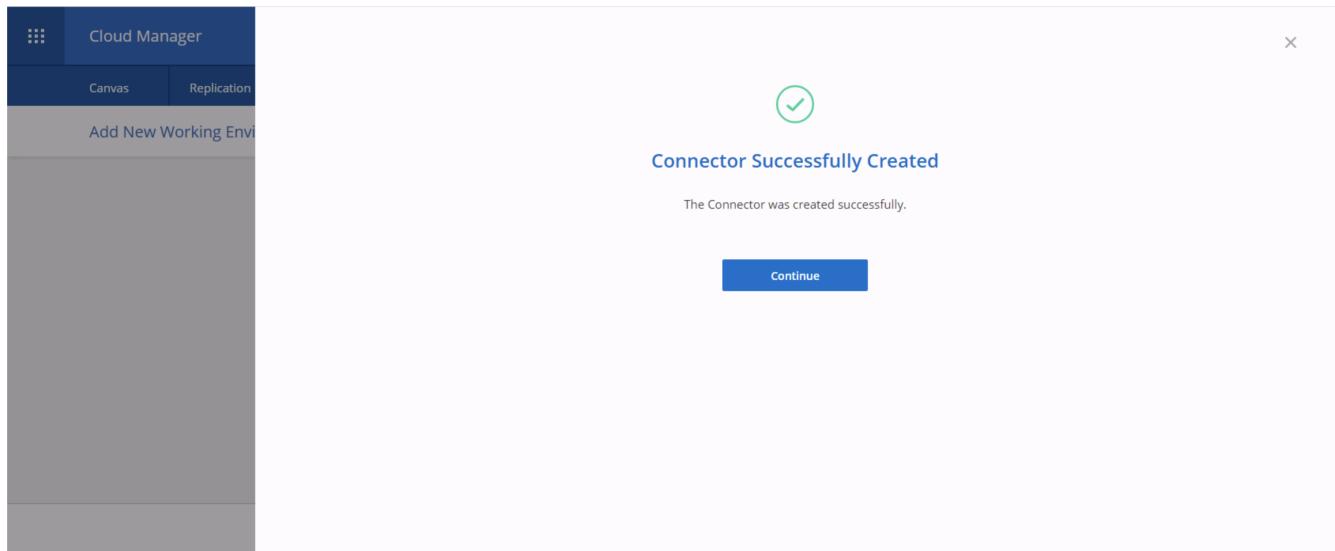

10. Review the information on the summary page and click Add to deploy the connector.

11. The connector now deploys using a cloud formation stack. You can monitor its progress from Cloud Manager or through AWS.

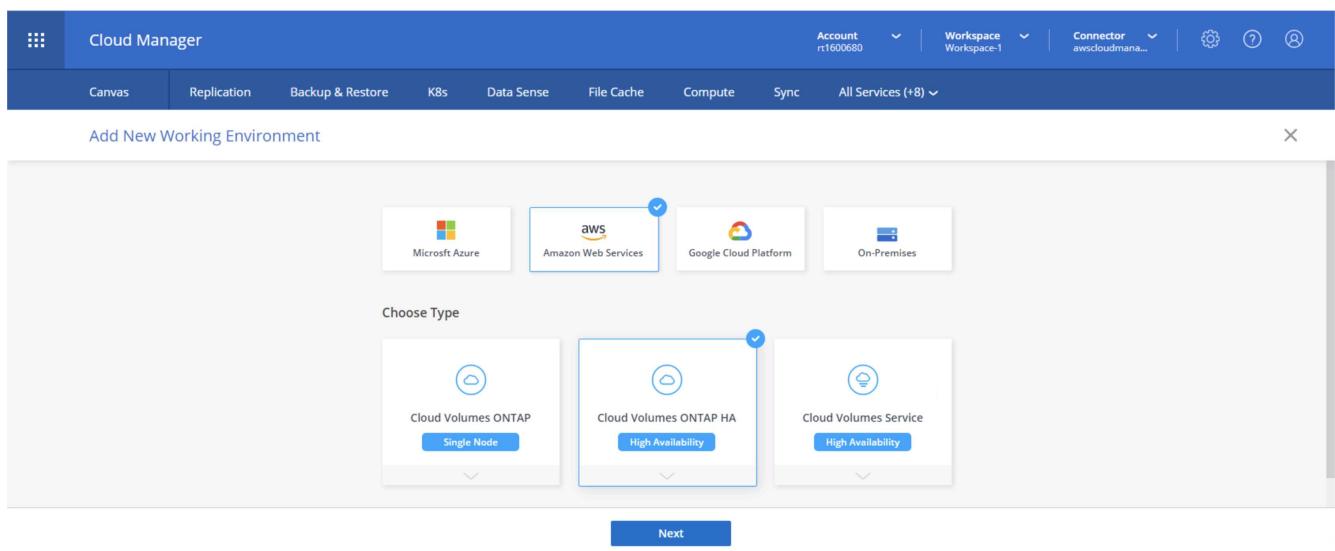

12. When the deployment is complete, a success page appears.

## Deploy Cloud Volumes ONTAP

1. Select AWS and the type of deployment based on your requirements.

2. If no subscription has been assigned and you wish to purchase with PAYGO, choose Edit Credentials.

Create a New Working Environment

Details and Credentials

### 4. Choose the type of contract that you wish to subscribe to. I chose Pay-as-you-go.

Create a New Working Environment

Edit Credentials & Add Subscription

Select a subscription option and click Continue. The AWS Marketplace enables you to view pricing details and then subscribe.

Pay-Per-TiB - Annual Contract  
Pay for Cloud Volumes ONTAP with an annual, upfront payment.

Pay-as-you-go  
Pay for Cloud Volumes ONTAP at an hourly rate.

The next steps:

- ① AWS Marketplace  
Subscribe and then click Set Up Your Account to configure your account.
- ② Cloud Manager  
Save your subscription and associate the Marketplace subscription with your AWS credentials.

Continue      Cancel

Cloud Manager 3.9.9 Build: 0 Aug 18, 2021 04:13:35 am UTC

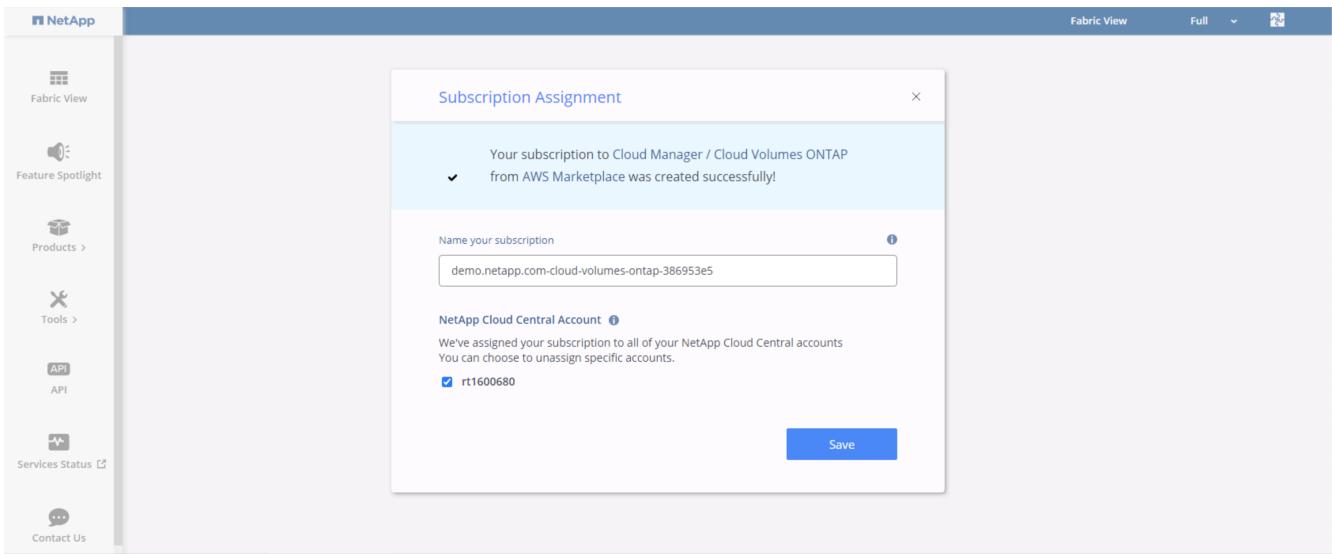

5. You are redirected to AWS; choose Continue to Subscribe.

The screenshot shows the AWS Marketplace interface for the NetApp Cloud Manager product. The product title is 'Cloud Manager - Deploy & Manage NetApp Cloud Data Services'. It is sold by 'NetApp, Inc.'. A 'Continue to Subscribe' button is visible at the top right. Below the title, there is a brief description of the product's features and a 'Show more' link. The 'Overview' tab is selected, showing a 'Product Overview' section with a list of features and a 'Highlights' section with bullet points. Other tabs include 'Pricing', 'Usage', 'Support', and 'Reviews'.

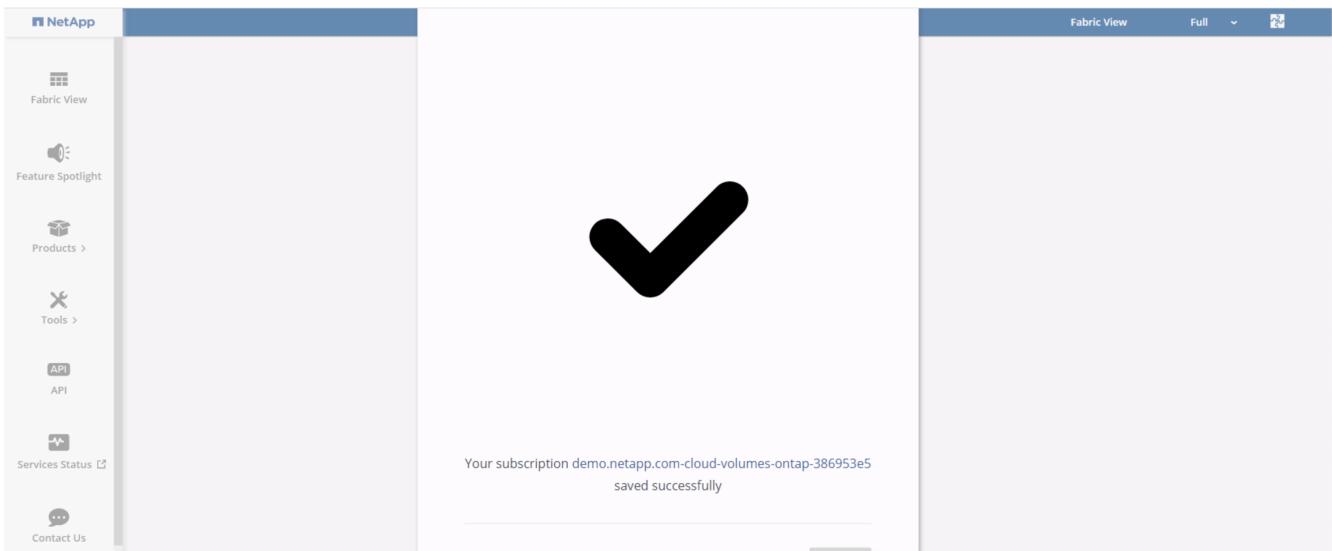

6. Subscribe and you are redirected back to NetApp Cloud Central. If you have already subscribed and don't get redirected, choose the "Click here" link.

The screenshot shows the AWS Marketplace interface for the NetApp Cloud Manager product. A message at the top states 'You are extended multiple offers! Select an offer first and review the pricing information and EULA.' Below this, there is a dropdown menu for 'Offer name' set to 'NetApp, Inc. for SaaS 2020-07-20- Private Offer - current subscription'. To the right, a box titled 'You Are Subscribed to This Offer' provides details about the offer, including the vendor, offer ID, and expiration date. Another box titled 'You Have Subscribed to a Private Offer' explains the private offer status and the date it will expire. At the bottom, there is a 'Subscribe' button and a note about agreeing to the EULA and terms.

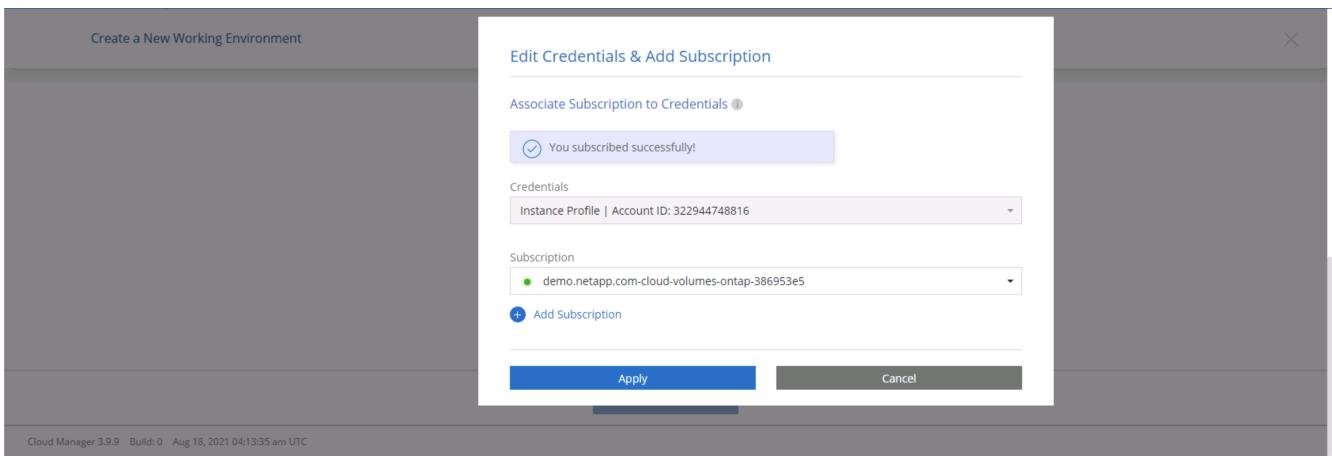

7. You are redirected to Cloud Central where you must name your subscription and assign it to your Cloud Central account.

- When successful, a check mark page appears. Navigate back to your Cloud Manager tab.

- The subscription now appears in Cloud Central. Click Apply to continue.

- Enter the working environment details such as:

- Cluster name

- b. Cluster password
- c. AWS tags (Optional)

The screenshot shows the 'Create a New Working Environment' interface in Cloud Manager. At the top, there are tabs for Canvas, Replication, Backup & Restore, K8s, Data Sense, File Cache, Compute, Sync, and All Services (+8). The 'Details and Credentials' tab is selected. On the left, there's a 'Previous Step' button and an 'Instance Profile' section with fields for '322944748816' and 'demo.netapp.com-cloud-vol...'. On the right, there's a 'Workspace' dropdown set to 'Workspace-1', a 'Connector' dropdown set to 'awscloudman...', and a 'Edit Credentials' button. Below these, there are two sections: 'Details' and 'Credentials'. The 'Details' section contains a 'Working Environment Name (Cluster Name)' field with 'hybridawscvo' entered. The 'Credentials' section contains fields for 'User Name' ('admin'), 'Password' (redacted), and 'Confirm Password' (redacted). A 'Continue' button is at the bottom.

11. Choose which additional services you would like to deploy. To discover more about these services, visit the [NetApp Cloud Homepage](#).

The screenshot shows the 'Services' configuration step in Cloud Manager. At the top, there are tabs for Canvas, Replication, Backup & Restore, K8s, Data Sense, File Cache, Compute, Sync, and All Services (+8). The 'Services' tab is selected. On the left, there's a 'Previous Step' button. The main area lists three services with toggle switches: 'Data Sense & Compliance' (on), 'Backup to Cloud' (on), and 'Monitoring' (on). A 'Continue' button is at the bottom.

12. Choose whether to deploy in multiple availability zones (requires three subnets, each in a different AZ), or a single availability zone. I chose multiple AZs.

The screenshot shows the Cloud Manager interface with the title "Create a New Working Environment" and "HA Deployment Models". It compares "Multiple Availability Zones" and "Single Availability Zone".

- Multiple Availability Zones:**
  - Provides maximum protection against AZ failures.
  - Enables selection of 3 availability zones.
  - An HA node serves data if its partner goes offline.
- Single Availability Zone:**
  - Protects against failures within a single AZ.
  - Single availability zone. HA nodes are in a placement group, spread across distinct underlying hardware.
  - An HA node serves data if its partner goes offline.

Both sections have "Extended Info" links at the bottom.

Cloud Manager 3.9.9 Build: 0 Aug 18, 2021 04:13:35 am UTC

13. Choose the region, VPC, and security group for the cluster to be deployed into. In this section, you also assign the availability zones per node (and mediator) as well as the subnets that they occupy.

The screenshot shows the Cloud Manager interface with the title "Region & VPC". It includes fields for AWS Region (US East | N. Virginia), VPC (vpc-083fcbd79f75dfb6e - 10.221.0.0/16), and Security group (Use a generated security group).

Below these fields are three sections for "Node 1", "Node 2", and "Mediator", each with "Availability Zone" and "Subnet" dropdowns. "Subnet" is selected for the Mediator's availability zone.

A "Continue" button is at the bottom.

Cloud Manager 3.9.9 Build: 0 Aug 18, 2021 04:13:35 am UTC

14. Choose the connection methods for the nodes as well as the mediator.

The screenshot shows the Cloud Manager interface with the title "Connectivity & SSH Authentication". It includes sections for "Nodes" and "Mediator".

**Nodes:** SSH Authentication Method is set to "Password".

**Mediator:** Security Group is "Use a generated security group", Key Pair Name is "rt1600680", and Internet Connection Method is "Public IP address".

A "Continue" button is at the bottom.

Cloud Manager 3.9.9 Build: 0 Aug 18, 2021 04:13:35 am UTC

The mediator requires communication with the AWS APIs. A public IP address is not required so long as the APIs are reachable after the mediator EC2 instance has been deployed.

1. Floating IP addresses are used to allow access to the various IP addresses that Cloud Volumes ONTAP uses, including cluster management and data serving IPs. These must be addresses that are not already routable within your network and are added to route tables in your AWS environment. These are required to enable consistent IP addresses for an HA pair during failover. More information about floating IP addresses can be found in the [NetApp Cloud Documentation](#).

The screenshot shows the 'Cloud Manager' interface with the 'Floating IPs' step selected. It includes fields for entering floating IP addresses for cluster management, NFS/CIFS data, SVM management, and an optional floating IP address. A note explains that floating IP addresses are required for cluster and SVM access and for NFS and CIFS data access, and that they can migrate between HA nodes if failures occur. A 'Continue' button is at the bottom.

2. Select which route tables the floating IP addresses are added to. These route tables are used by clients to communicate with Cloud Volumes ONTAP.

The screenshot shows the 'Cloud Manager' interface with the 'Route Tables' step selected. It displays a table of route tables, with two checked: 'private\_rt\_rt1600680' and 'public\_rt\_rt1600680'. A note states that selecting route tables enables client access to the Cloud Volumes ONTAP HA pair. An 'Additional Information' link is available. A 'Continue' button is at the bottom.

3. Choose whether to enable AWS managed encryption or AWS KMS to encrypt the ONTAP root, boot, and data disks.

Capacity Limit:	10TB	Customer Master Key:	aws/ebs

Go

Cloud Manager 3.9.9 Build: 0 Aug 18, 2021 04:13:35 am UTC

8. Cloud Volumes ONTAP now starts its deployment process. Cloud Manager uses AWS APIs and cloud formation stacks to deploy Cloud Volumes ONTAP. It then configures the system to your specifications, giving you a ready-to-go system that can be instantly utilized. The timing for this process varies depending on the selections made.

The screenshot shows the Cloud Manager Canvas interface. At the top, there are tabs for Canvas, Replication, Backup & Restore, K8s, Data Sense, File Cache, Compute, Sync, and All Services (+8). The Canvas tab is selected. The main area displays a cloud icon labeled 'hybridawscvo' containing 'Cloud Volumes ONTAP' and 'aws'. Below it, another cloud icon labeled 'Amazon S3' shows '1 Buckets' and '1 Region'. To the right, a section titled 'Working environments' lists '1 Cloud Volumes ONTAP (High-Availability)' and '0 B Allocated Capacity'. Another section lists '1 Amazon S3' and '0 Buckets'. At the bottom right of the main area are a minus and plus button.

9. You can monitor the progress by navigating to the Timeline.

The screenshot shows the Cloud Manager Timeline interface. At the top, there are tabs for Canvas, Replication, Backup & Restore, K8s, Data Sense, File Cache, Compute, Sync, and All Services (+8). The Timeline tab is selected. The main area is divided into two sections: 'Resources' and 'Services'. The 'Resources' section includes 'Canvas', 'Digital Wallet', and 'Timeline'. The 'Services' section includes 'Replication', 'Backup & Restore', 'K8s', 'Data Sense', 'Compliance', 'Tiering', 'Monitoring', 'File Cache', 'Compute', 'Sync', 'SnapCenter', and 'Active IQ'. A link to 'https://cloudmanager.netapp.com/timeline' is visible at the bottom left.

10. The Timeline acts as an audit of all actions performed in Cloud Manager. You can view all of the API calls that are made by Cloud Manager during setup to both AWS as well as the ONTAP cluster. This can also be effectively used to troubleshoot any issues that you face.

The screenshot shows the Cloud Manager interface with the 'Timeline' tab selected. At the top, there are filters for Time, Service, Action, Agent, Resource, User, and Status, with 'Agent (1)' currently selected. The timeline table lists three events:

Time	Action	Service	Agent	Resource	User	Status
Aug 18 2021, 9:42:32 pm	Check Connectivity	Cloud Manager	awscloudman...	hybridawscvo	Full Name	Success
Aug 18 2021, 9:42:00 pm	Create Aws Ha Working Environment	Cloud Manager	awscloudma...	hybridawscvo	Full Name	Pending
Aug 18 2021, 10:09:39 pm	Describe Operation Status					Success
Aug 19 2021, 10:00:20 pm	Describe Operation Status					Success

- After deployment is complete, the CVO cluster appears on the Canvas, which the current capacity. The ONTAP cluster in its current state is fully configured to allow a true, out-of-the-box experience.

The screenshot shows the Cloud Manager interface with the 'Canvas' tab selected. On the left, there's a cloud icon labeled 'Add Working Environment'. In the center, there are two clouds representing environments: one for 'Cloud Volumes ONTAP' (labeled 'hybridawscvo' and '1 GiB Capacity') and one for 'Amazon S3' (labeled '2 Buckets' and '1 Region'). On the right, a sidebar titled 'Working environments' lists the deployed resources:

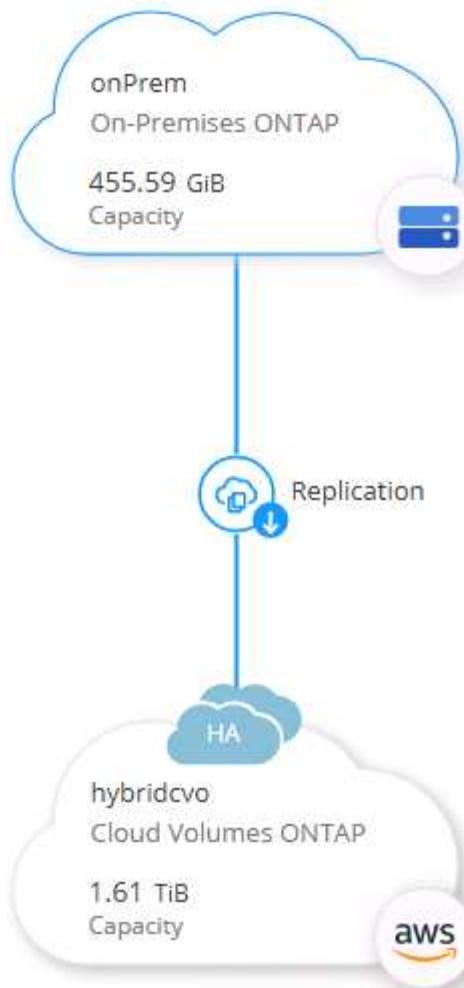

- 1 Cloud Volumes ONTAP (High-Availability)  
1 GiB Allocated Capacity
- 1 Amazon S3  
0 Buckets

## Configure SnapMirror from on-premises to cloud

Now that you have a source ONTAP system and a destination ONTAP system deployed, you can replicate volumes containing database data into the cloud.

For a guide on compatible ONTAP versions for SnapMirror, see the [SnapMirror Compatibility Matrix](#).

- Click the source ONTAP system (on-premises) and either drag and drop it to the destination, select Replication > Enable, or select Replication > Menu > Replicate.

---

Select Enable.

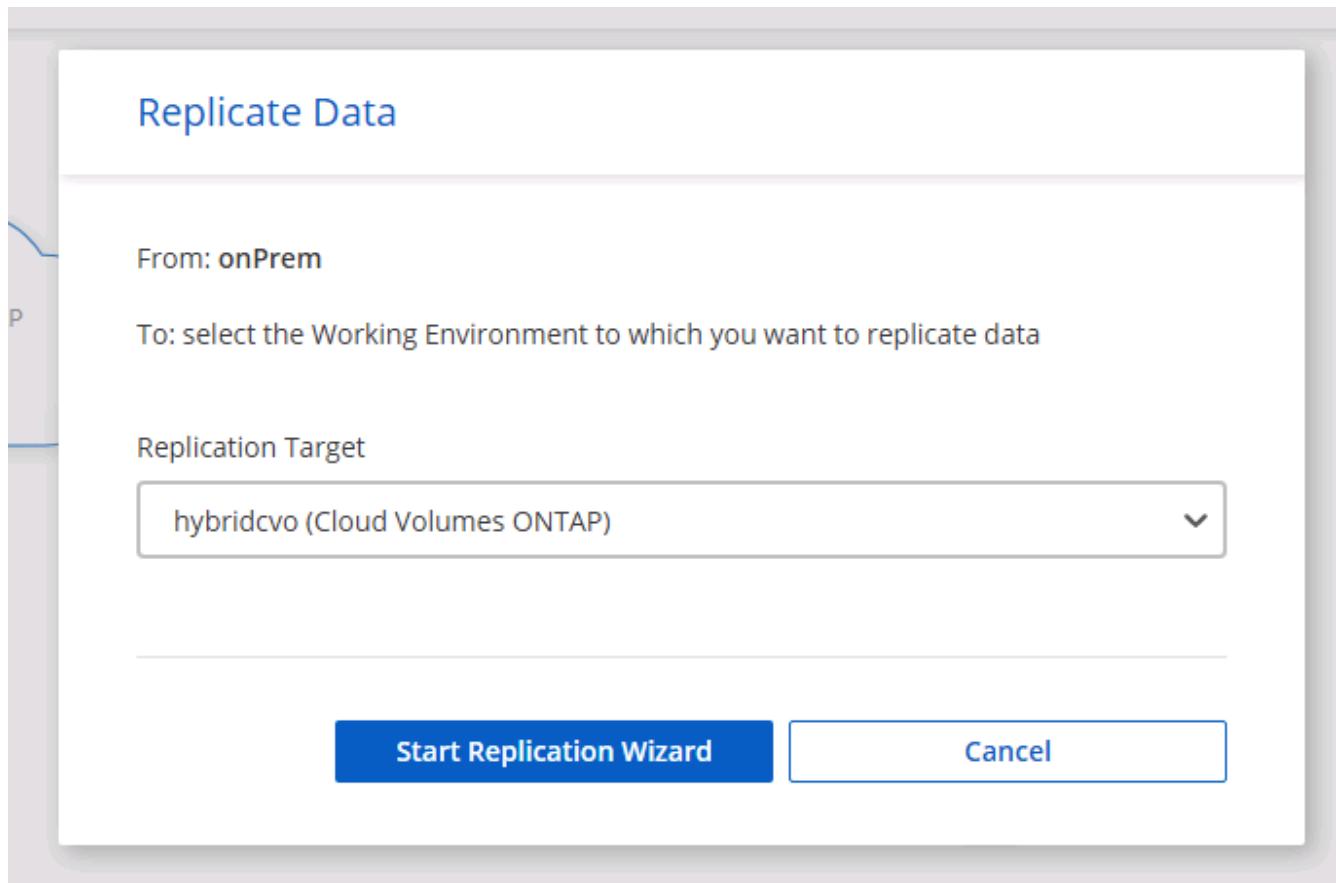

Or Options.

The screenshot shows the configuration for the 'onPrem' cluster. At the top, there is a circular icon with two servers, followed by the text 'onPrem' and a green square indicating 'On'. To the right are three blue circular icons with symbols for information, more options, and delete. Below this, the word 'DETAILS' is in bold capital letters. Under 'DETAILS', the text 'On-PremisesONTAP' is displayed. In the 'SERVICES' section, there is another circular icon with a cloud and server, followed by the text 'Replication' and a green square indicating 'On'. To the right, it shows '1 Replication Target' with a blue circular icon containing three dots. A horizontal line separates this from the bottom section.

Replicate.

This screenshot is similar to the one above, showing the 'onPrem' cluster configuration. The 'Replication' service is listed as 'On' with 1 target. A dropdown menu is open over the 'Replication Target' entry, containing two items: 'View Replications' and 'Replicate'. The 'Replicate' option is highlighted with a blue arrow icon. The rest of the interface elements are identical to the first screenshot.

2. If you did not drag and drop, choose the destination cluster to replicate to.

3. Choose the volume that you'd like to replicate. We replicated the data and all log volumes.

Source Volume Selection			
<b>rhel2_u03</b> INFO Storage VM Name: svm_onPrem Tiering Policy: None Volume Type: RW CAPACITY 100 GB Allocated 7.29 GB Disk Used	<b>rhel2_u03</b> INFO Storage VM Name: svm_onPrem Tiering Policy: None Volume Type: RW CAPACITY 100 GB Allocated 35.83 MB Disk Used	<b>sql1_data</b> INFO Storage VM Name: svm_onPrem Tiering Policy: None Volume Type: RW CAPACITY 53.37 GB Allocated 45.09 GB Disk Used	
<b>sql1_log</b> INFO Storage VM Name: svm_onPrem Tiering Policy: None Volume Type: RW CAPACITY 21.35 GB Allocated 18.16 GB Disk Used	<b>sql1_snapctr</b> INFO Storage VM Name: svm_onPrem Tiering Policy: None Volume Type: RW CAPACITY 24.87 GB Allocated 21.23 GB Disk Used		

Cloud Manager 3.9.10 Build: 2 Sep 12, 2021 06:47:41 am UTC

4. Choose the destination disk type and tiering policy. For disaster recovery, we recommend an SSD as the disk type and to maintain data tiering. Data tiering tiers the mirrored data into low-cost object storage and saves you money on local disks. When you break the relationship or clone the volume, the data uses the fast, local storage.

[↑ Previous Step](#)

## Destination Disk Type

## S3 TIERING

[What are storage tiers?](#) Enabled    DisabledNote: If you enable S3 tiering, thin provisioning must be enabled on volumes created in this aggregate.[Continue](#)

Cloud Manager 3.9.10 Build:2 Sep 12, 2021 06:47:41 am UTC

5. Select the destination volume name: we chose [source\_volume\_name]\_dr.

## Destination Volume Name

## Destination Volume Name

sql1\_data\_dr

## Destination Aggregate

Automatically select the best aggregate ▾

6. Select the maximum transfer rate for the replication. This enables you to save bandwidth if you have a low bandwidth connection to the cloud such as a VPN.

## Max Transfer Rate

You should limit the transfer rate. An unlimited rate might negatively impact the performance of other applications and it might impact your Internet performance.

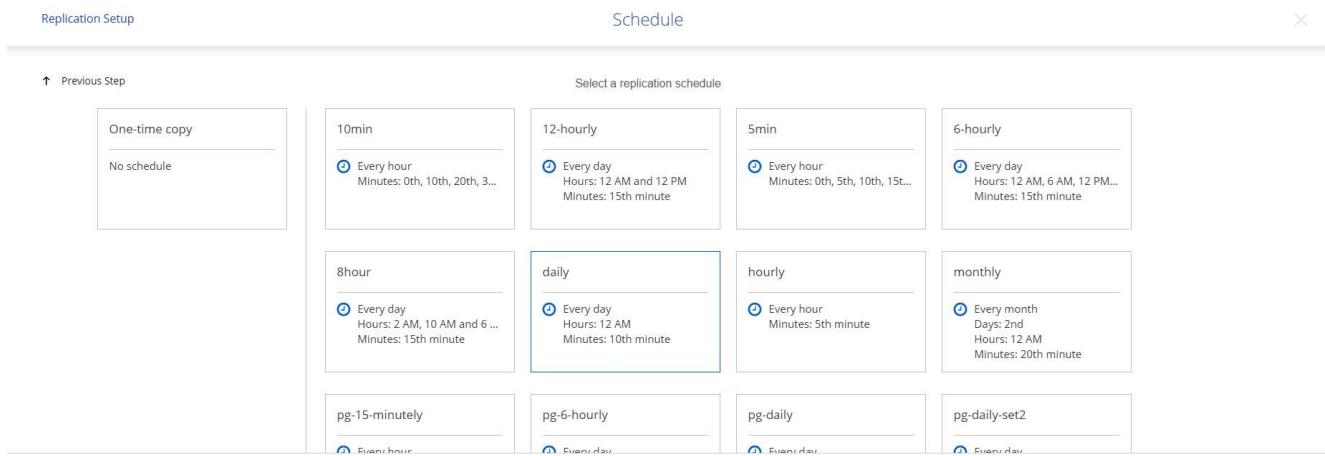

- Limited to:  MB/s
- Unlimited (recommended for DR only machines)

7. Define the replication policy. We chose a Mirror, which takes the most recent dataset and replicates that into the destination volume. You could also choose a different policy based on your requirements.

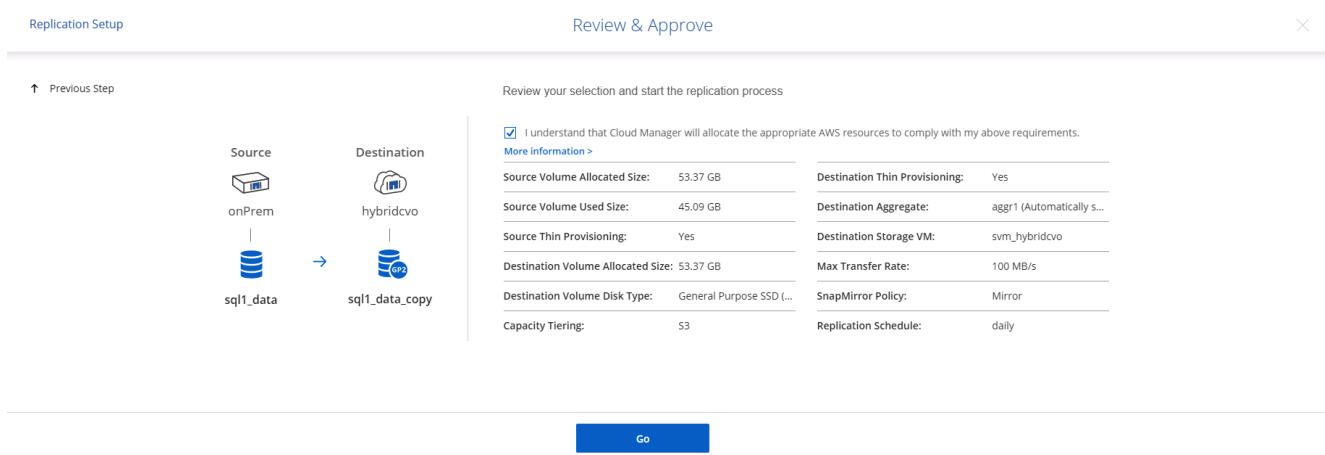

### Replication Policy

Default Policies	Additional Policies
<p> <b>Mirror</b></p> <p>Typically used for disaster recovery</p> <p><a href="#">More info</a></p>	<p> <b>Mirror and Backup (1 month retention)</b></p> <p>Configures disaster recovery and long-term retention of backups on the same destination volume</p> <p><a href="#">More info</a></p>

8. Choose the schedule for triggering replication. NetApp recommends setting a "daily" schedule of for the data volume and an "hourly" schedule for the log volumes, although this can be changed based on requirements.

9. Review the information entered, click Go to trigger the cluster peer and SVM peer (if this is your first time replicating between the two clusters), and then implement and initialize the SnapMirror relationship.

10. Continue this process for data volumes and log volumes.

11. To check all of your relationships, navigate to the Replication tab inside Cloud Manager. Here you can manage your relationships and check on their status.

Health Status	Source Volume	Target Volume	Total Transfer Time	Status	Mirror State	Last Successful Transfer
<span>✓</span>	rhel2_u01 onPrem	rhel2_u01_dr hybridcvo	43 minutes 43 seconds	idle	snapmirrored	Sep 30, 2021, 12:12:50 AM 19.73 MB
<span>✓</span>	rhel2_u02 onPrem	rhel2_u02_dr hybridcvo	1 hour 37 minutes 59 seconds	idle	snapmirrored	Sep 30, 2021, 2:37:08 PM 239.78 MB
<span>✓</span>	rhel2_u03 onPrem	rhel2_u03_dr hybridcvo	16 hours 1 minute 9 seconds	idle	snapmirrored	Sep 30, 2021, 4:07:14 PM 225.37 kB
<span>✓</span>	sql1_data onPrem	sql1_data_dr hybridcvo	1 hour 6 minutes 50 seconds	idle	snapmirrored	Sep 30, 2021, 12:12:28 AM 24.56 kB

12. After all the volumes have been replicated, you are in a steady state and ready to move on to the disaster recovery and dev/test workflows.

### **3. Deploy EC2 compute instance for database workload**

AWS has preconfigured EC2 compute instances for various workloads. The choice of instance type determines the number of CPU cores, memory capacity, storage type and capacity, and network performance. For the use cases, with the exception of the OS partition, the main storage to run database workload is allocated from CVO or the FSx ONTAP storage engine. Therefore, the main factors to consider are the choice of CPU cores, memory, and network performance level. Typical AWS EC2 instance types can be found here: [EC2 Instance Type](#).

#### **Sizing the compute instance**

1. Select the right instance type based on the required workload. Factors to consider include the number of business transactions to be supported, the number of concurrent users, data set sizing, and so on.
2. EC2 instance deployment can be launched through the EC2 Dashboard. The exact deployment procedures are beyond the scope of this solution. See [Amazon EC2](#) for details.

#### **Linux instance configuration for Oracle workload**

This section contain additional configuration steps after an EC2 Linux instance is deployed.

1. Add an Oracle standby instance to the DNS server for name resolution within the SnapCenter management domain.
2. Add a Linux management user ID as the SnapCenter OS credentials with sudo permissions without a password. Enable the ID with SSH password authentication on the EC2 instance. (By default, SSH password authentication and passwordless sudo is turned off on EC2 instances.)
3. Configure Oracle installation to match with on-premises Oracle installation such as OS patches, Oracle versions and patches, and so on.
4. NetApp Ansible DB automation roles can be leveraged to configure EC2 instances for database dev/test and disaster recovery use cases. The automation code can be download from the NetApp public GitHub site: [Oracle 19c Automated Deployment](#). The goal is to install and configure a database software stack on an EC2 instance to match on-premises OS and database configurations.

#### **Windows instance configuration for SQL Server workload**

This section lists additional configuration steps after an EC2 Windows instance is initially deployed.

1. Retrieve the Windows administrator password to log in to an instance via RDP.
2. Disable the Windows firewall, join the host to Windows SnapCenter domain, and add the instance to the DNS server for name resolution.
3. Provision a SnapCenter log volume to store SQL Server log files.
4. Configure iSCSI on the Windows host to mount the volume and format the disk drive.
5. Again, many of the previous tasks can be automated with the NetApp automation solution for SQL Server. Check the NetApp automation public GitHub site for newly published roles and solutions: [NetApp Automation](#).

Next: [Workflow for dev/test bursting to cloud](#).

## **Workflow for dev/test bursting to cloud**

Previous: [Getting Started with AWS public cloud](#).

The agility of the public cloud, the time to value, and the cost savings are all meaningful value propositions for enterprises adopting the public cloud for database application development and testing effort. There is no better tool than SnapCenter to make this a reality. SnapCenter can not only protect your production database on-premises, but can also quickly clone a copy for application development or code testing in the public cloud while consuming very little extra storage. Following are details of the step-by-step processes for using this tool.

### Clone an Oracle Database for dev/test from a replicated snapshot backup

1. Log into SnapCenter with a database management user ID for Oracle. Navigate to the Resources tab, which shows the Oracle databases being protected by SnapCenter.

Name	Oracle Database Type	Host/Cluster	Resource Group	Policies	Last Backup	Overall Status
cdb2	Single Instance (Multitenant)	rhel2.demo.netapp.com	rhel2_cdb2 rhel2_cdb2_log	Oracle Archive Log Backup Oracle Full Online Backup	09/17/2021 3:00:09 PM	Backup succeeded

2. Click the intended on-premises database name for the backup topology and the detailed view. If a secondary replicated location is enabled, it shows linked mirror backups.

Backup Name	Count	Type	End Date	Verified	Mounted	RMAN Cataloged	SCN
rhel2_cdb2_log_09-17-2021_15.00.01.1317_1	1	Log	09/17/2021 3:00:10 PM	Not Applicable	False	Not Cataloged	5980203
rhel2_cdb2_09-17-2021_14.35.01.4997_1	1	Log	09/17/2021 2:35:21 PM	Not Applicable	False	Not Cataloged	5980629
rhel2_cdb2_09-17-2021_14.35.01.4997_0	1	Data	09/17/2021 2:35:12 PM	Unverified	False	Not Cataloged	5980588
rhel2_cdb2_log_09-17-2021_14.00.01.1042_1	1	Log	09/17/2021 2:00:10 PM	Not Applicable	False	Not Cataloged	5978388
rhel2_cdb2_log_09-17-2021_13.00.01.7389_1	1	Log	09/17/2021 1:00:11 PM	Not Applicable	False	Not Cataloged	5975135
rhel2_cdb2_log_09-17-2021_12.00.01.1142_1	1	Log	09/17/2021 12:00:10 PM	Not Applicable	False	Not Cataloged	5971773
rhel2_cdb2_log_09-17-2021_11.00.01.0895_1	1	Log	09/17/2021 11:00:10 AM	Not	False	Not Cataloged	5968474

3. Toggled to the mirrored backups view by clicking mirrored backups. The secondary mirror backup(s) is then displayed.

Total 1

- Choose a mirrored secondary database backup copy to be cloned and determine a recovery point either by time and system change number or by SCN. Generally, the recovery point should be trailing the full database backup time or SCN to be cloned. After a recovery point is decided, the required log file backup must be mounted for recovery. The log file backup should be mounted to target DB server where the clone database is to be hosted.

Mount backups

Choose the host to mount the backup : ora-standby.demo.netapp.com

Mount path : /var/opt/snapcenter/sco/backup\_mount/rhel2\_cdb2\_09-17-2021\_14.35.01.4997\_1/cdb2

Secondary storage location : Snap Vault / Snap Mirror

Source Volume	Destination Volume
svm_onPrem:rhel2_u03	svm_hybridcvo:rhel2_u03_dr

Mount Cancel

Backup Name	Count	Type	End Date	Verified	Mounted	RMAN Cataloged	SCN

## Clone a SQL database for dev/test from a replicated Snapshot backup

1. Log into SnapCenter with a database management user ID for SQL Server. Navigate to the Resources tab, which shows the SQL Server user databases being protected by SnapCenter and a target standby SQL instance in the public cloud.

Name	Instance	Host	Last Backup	Overall Status	Type
master	sql1	sql1.demo.netapp.com		Not available for backup	System database
model	sql1	sql1.demo.netapp.com		Not available for backup	System database
msdb	sql1	sql1.demo.netapp.com		Not available for backup	System database
tempdb	sql1	sql1.demo.netapp.com		Not available for backup	System database
tpcc	sql1	sql1.demo.netapp.com	09/16/2021 7:35:05 PM	Backup succeeded	User database
master	sql1-standby	sql1-standby.demo.netapp.com		Not available for backup	System database
model	sql1-standby	sql1-standby.demo.netapp.com		Not available for backup	System database
msdb	sql1-standby	sql1-standby.demo.netapp.com		Not available for backup	System database
tempdb	sql1-standby	sql1-standby.demo.netapp.com		Not available for backup	System database

2. Click on the intended on-premises SQL Server user database name for the backups topology and detailed view. If a secondary replicated location is enabled, it shows linked mirror backups.

Primary Backup(s)	Count	Type	End Date	Verified
sql1_tpcc_09-16-2021_18.25.01.4024	1	Full backup	09/16/2021 6:25:05 PM	Unverified
sql1_tpcc_09-15-2021_18.25.01.4604	1	Full backup	09/15/2021 6:25:06 PM	Unverified

## Post-clone configuration

- An Oracle production database on-premises is usually running in log archive mode. This mode is not necessary for a development or test database. To turn off log archive mode, log into the Oracle DB as sysdba, execute a log mode change command, and start the database for access.
- Configure an Oracle listener, or register the newly cloned DB with an existing listener for user access.
- For SQL Server, change the log mode from Full to Easy so that the SQL Server dev/test log file can be readily shrunk when it is filling up the log volume.

## Refresh clone database

1. Drop cloned databases and clean up the cloud DB server environment. Then follow the previous procedures to clone a new DB with fresh data. It only takes few minutes to clone a new database.
2. Shutdown the clone database, run a clone refresh command by using the CLI. See the following SnapCenter documentation for details: [Refresh a clone](#).

## Where to go for help?

If you need help with this solution and use cases, join the [NetApp Solution Automation community support Slack channel](#) and look for the solution-automation channel to post your questions or inquires.

Next: [Disaster recovery workflow](#).

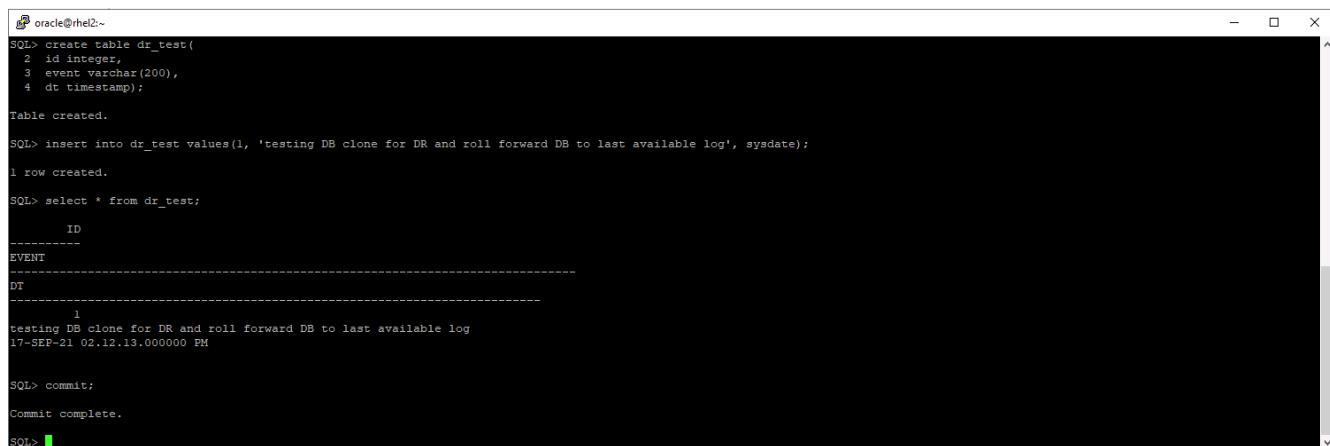

## Disaster recovery workflow

Previous: [Workflow for dev/test bursting to cloud](#).

Enterprises have embraced the public cloud as a viable resource and destination for disaster recovery. SnapCenter makes this process as seamless as possible. This disaster recovery workflow is very similar to the clone workflow, but database recovery runs through the last available log that was replicated to cloud to recover all the business transactions possible. However, there are additional pre-configuration and post-configuration steps specific to disaster recovery.

### Clone an on-premises Oracle production DB to cloud for DR

1. To validate that the clone recovery runs through last available log, we created a small test table and inserted a row. The test data would be recovered after a full recovery to last available log.

```
oracle@rhel2:~$ SQL> create table dr_test(
  2  id integer,
  3  event varchar(200),
  4  dt timestamp);
Table created.

SQL> insert into dr_test values(1, 'testing DB clone for DR and roll forward DB to last available log', sysdate);
1 row created.

SQL> select * from dr_test;
      ID
      -----
     EVENT
     -----
      DT
      -----
      1
testing DB clone for DR and roll forward DB to last available log
17-SEP-21 02.12.13.000000 PM

SQL> commit;
Commit complete.

SQL>
```

2. Log into SnapCenter as a database management user ID for Oracle. Navigate to the Resources tab, which shows the Oracle databases being protected by SnapCenter.

The screenshot shows the NetApp SnapCenter interface. On the left, there's a sidebar with icons for Dashboard, Resources (selected), Monitor, Reports, Hosts, Storage Systems, Settings, and Alerts. The main area has a dropdown menu set to 'Oracle Database'. Below it, a search bar says 'Resource Group' and a search field contains 'rhe12\_cdb2\_log'. A table lists resources under 'rhe12\_cdb2' and 'rhe12\_cdb2\_log'. The 'rhe12\_cdb2\_log' row has a 'Tags' column with 'orafullbkup' and a 'Policies' column with 'Oracle Full Online Backup'. The 'Last Backup' column shows '09/17/2021 2:38:16 PM' and the 'Overall Status' column shows 'Completed'. A 'New Resource Group' button is in the top right.

3. Select the Oracle log resource group and click Backup Now to manually run an Oracle log backup to flush the latest transaction to the destination in the cloud. In a real DR scenario, the last transaction recoverable depends on the database log volume replication frequency to the cloud, which in turn depends on the RTO or RPO policy of the company.

This screenshot shows the 'rhe12\_cdb2\_log' resource group details. The left sidebar is identical to the previous screenshot. The main area shows a table with columns: Name, Resource Name, Type, and Host. The 'rhe12\_cdb2' row has 'cdb2' in Resource Name, 'Oracle Database' in Type, and 'rhe12.demo.netapp.com' in Host. There are buttons for 'Modify Resource Group', 'Backup Now', 'Maintenance', and 'Delete' at the top right.

This screenshot shows the 'Backup' dialog box. It has a title 'Backup' and a sub-instruction 'Create a backup for the selected resource group'. It displays the selected 'Resource Group' as 'rhe12\_cdb2\_log' and the selected 'Policy' as 'Oracle Archive Log Backup'. At the bottom, there are 'Cancel' and 'Backup' buttons.

Asynchronous SnapMirror loses data that has not made it to the cloud destination in the database log backup interval in a disaster recovery scenario. To minimize data loss, more frequent log backup can be scheduled. However there is a limit to the log backup frequency that is technically achievable.

4. Select the last log backup on the Secondary Mirror Backup(s), and mount the log backup.

The screenshot shows the NetApp SnapCenter interface for Oracle Database management. On the left, a sidebar lists databases: cdb2, cdb2dev, and cdb2test. The main pane displays 'cdb2 Topology' with a diagram showing 'Local copies' (185 Backups, 0 Clones) connected to 'Mirror copies' (185 Backups, 2 Clones). A summary card on the right provides an overview of backups: 370 Backups, 16 Data Backups, 354 Log Backups, and 2 Clones. Below this, a table titled 'Secondary Mirror Backup(s)' lists three log backups:

Backup Name	Count	Type	End Date	Verified	Mounted	RMAN Cataloged	SCN
rhel2_cdb2_log_09-17-2021_18.20.04.1177_1	1	Log	09/17/2021 6:20:13 PM	Not Applicable	False	Not Cataloged	5994710
rhel2_cdb2_log_09-17-2021_18.00.01.2424_1	1	Log	09/17/2021 6:00:09 PM	Not Applicable	False	Not Cataloged	5992079
rhel2_cdb2_log_09-17-2021_17.00.01.1566_1	1	Log	09/17/2021 5:00:20 PM	Not Applicable	False	Not Cataloged	5988842

The dialog box is titled 'Mount backups'. It asks 'Choose the host to mount the backup' (set to 'ora-standby.demo.netapp.com') and specifies the 'Mount path' as '/var/opt/snapcenter/sco/backup\_mount/rhel2\_cdb2\_log\_09-17-2021\_18.20.04.1177\_1/cdb2'. It also shows the 'Secondary storage location : Snap Vault / Snap Mirror' section with 'Source Volume' set to 'svm\_onPrem:rhel2\_u03' and 'Destination Volume' set to 'svm\_hybridcvo:rhel2\_u03\_dr'. At the bottom are 'Mount' and 'Cancel' buttons.

5. Select the last full database backup and click Clone to initiate the clone workflow.

The screenshot shows the NetApp SnapCenter interface for managing Oracle databases. The top navigation bar includes links for Oracle Database, demoloradba, App Backup and Clone Admin, and Sign Out. The main area displays the 'cdb2 Topology' for the database 'cdb2'. It shows 'Manage Copies' with 'Local copies' (185 Backups, 0 Clones) and 'Mirror copies' (185 Backups, 2 Clones). A 'Summary Card' provides a quick overview of backup statistics: 370 Backups, 16 Data Backups, 354 Log Backups, and 2 Clones. Below this, a table lists 'Secondary Mirror Backup(s)' with columns for Backup Name, Count, Type, End Date, Verified, Mounted, RMAN Cataloged, and SCN. The table contains six entries, all of which are Log type backups.

## 6. Select a unique clone DB ID on the host.

The screenshot shows the 'Clone from cdb2' wizard in progress. The current step is '1 Name'. The 'Complete Database Clone' option is selected. The 'Clone SID' field is populated with 'cdb2dr'. The sidebar on the left lists the following steps: 1 Name, 2 Locations, 3 Credentials, 4 PreOps, 5 PostOps, 6 Notification, and 7 Summary. The right side of the screen shows configuration for the clone, including 'Secondary storage location : Snap Vault / Snap Mirror' and sections for 'Data' and 'Logs' mapping source volumes to destination volumes.

## 7. Provision a log volume and mount it to the target DR server for the Oracle flash recovery area and online logs.

The screenshot shows the ONTAP System Manager interface. On the left, there's a navigation sidebar with sections like DASHBOARD, STORAGE (Overview, Applications, Volumes), LUNs, Shares, Qtrees, Quotas, Storage VMs, Tiers, NETWORK, EVENTS & JOBS, PROTECTION, and HOSTS. The main area is titled 'Volumes' and lists several volumes: ora\_standby\_u01, rhel2\_u01\_dr, rhel2\_u02\_dr, rhel2\_u02\_dr09172116081193\_60, rhel2\_u02\_dr0917211703548\_63, rhel2\_u03\_dr, and rhel2\_u03\_dr09172118245747\_75. A modal window titled 'Add Volume' is open, prompting for a 'NAME' (set to 'ora\_standby\_u03') and 'CAPACITY' (set to '20 GB'). There are 'More Options' and 'Save' buttons.

```

Oracle Database 19c Enterprise Edition Release 19.0.0.0.0 - Production
Version 19.3.0.0.0

SQL> show parameter db_recovery_file_dest

NAME          TYPE        VALUE
-----
db_recovery_file_dest    string
db_recovery_file_dest_size   big integer 17208M
SQL> alter system set db_recovery_file_dest='/u03_cdb2dr/cdb2dr' scope=both;

System altered.

SQL> show parameter db_recovery_file_dest

NAME          TYPE        VALUE
-----
db_recovery_file_dest    string    /u03_cdb2dr/cdb2dr
db_recovery_file_dest_size   big integer 17208M
SQL>

```

## 3. Configure the Oracle listener for user access.

## 4. Split the cloned volume off of the replicated source volume.

## 5. Reverse replication from the cloud to on-premises and rebuild the failed on-premises database server.

Clone split may incur temporary storage space utilization that is much higher than normal operation. However, after the on-premises DB server is rebuilt, extra space can be released.

## Clone an on-premises SQL production DB to cloud for DR

- Similarly, to validate that the SQL clone recovery ran through last available log, we created a small test table and inserted a row. The test data would be recovered after a full recovery to the last available log.

```

Administrator: Command Prompt - sqlcmd - SQLCMD
C:\Users\administrator.DEMO>sqlcmd
1> select host_name()
2> go

-----
SQL1

(1 rows affected)
1> use tpcc
2> go
Changed database context to 'tpcc'.
1> insert into snap_sync values ('test snap mirror DR for SQL', getdate())
2> go

(1 rows affected)
1> select * from snap_sync
2> go
event                                dt
test snap mirror DR for SQL          2021-09-20 14:23:04.533
(1 rows affected)
1> -

```

- Log into SnapCenter with a database management user ID for SQL Server. Navigate to the Resources tab, which shows the SQL Server protection resources group.

Name	Resource Name	Type	Host
sql1_tpcc	tpcc (sql1)	SQL Database	sql1.demo.netapp.com
sql1_tpcc_log			

- Manually run a log backup to flush the last transaction to be replicated to secondary storage in the public cloud.

Backup

Create a backup for the selected resource group

Resource Group: sql1\_tpcc\_log

Policy: SQL Server Log Backup

Cancel      Backup

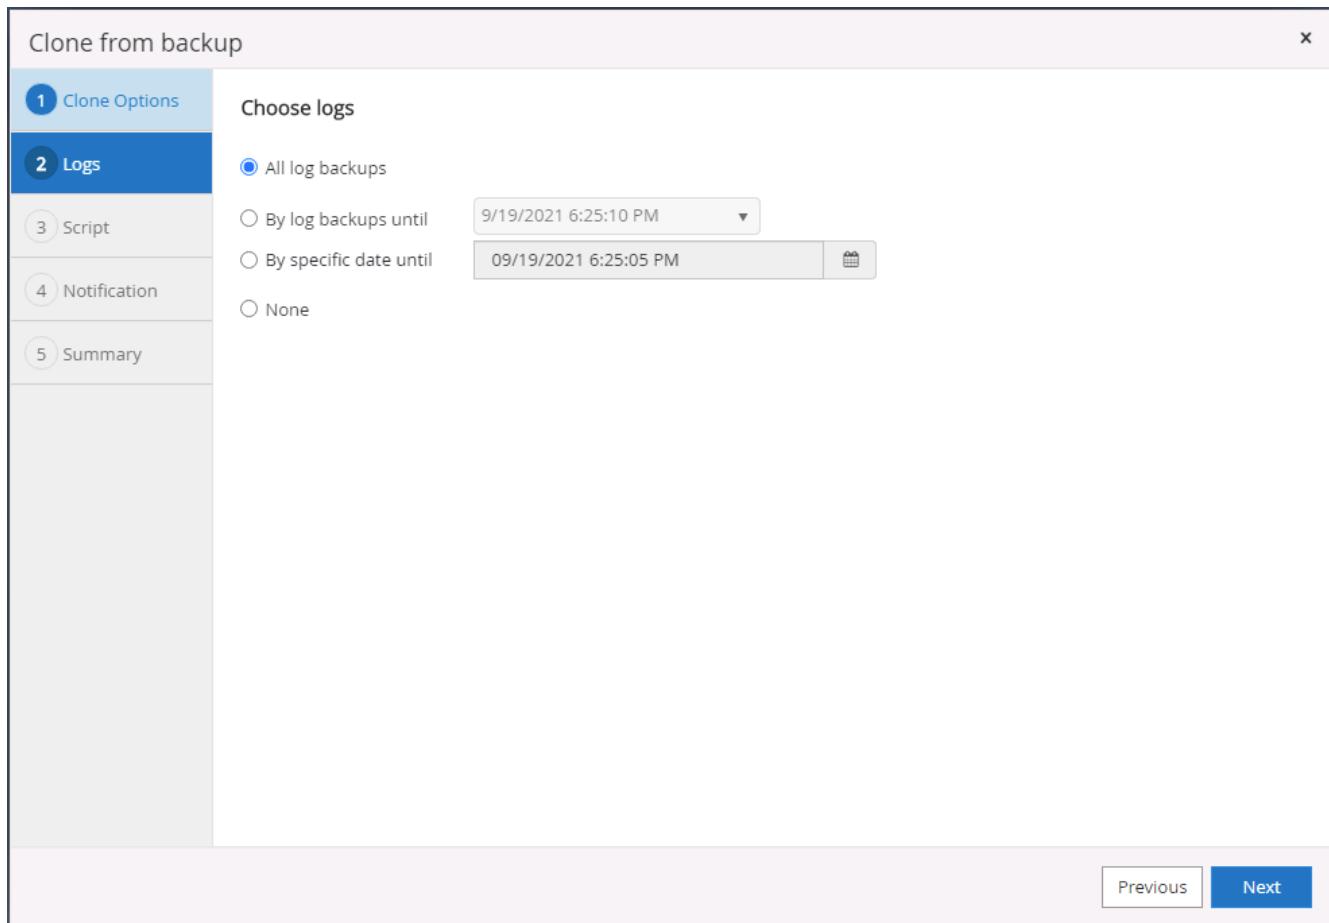

- Select the last full SQL Server backup for the clone.

The screenshot shows the NetApp SnapCenter interface for managing a Microsoft SQL Server topology named 'tpcc (sql11)'. On the left, a sidebar lists database names: master, model, msdb, tempdb, tpcc, and tpcc\_clone. The 'tpcc' entry is selected. The main pane displays 'Manage Copies' with a diagram showing 'Local copies' (7 Backups, 0 Clones) connected to 'Mirror copies' (7 Backups, 2 Clones). Below this, a table titled 'Secondary Mirror Backup(s)' lists three full backups: 'sql1\_tpcc\_09-19-2021\_18.25.01.4134', 'sql1\_tpcc\_09-18-2021\_18.25.01.3963', and 'sql1\_tpcc\_09-17-2021\_18.25.01.4218'. A summary card on the right indicates 14 Backups and 2 Clones.

- Set the clone setting such as the Clone Server, Clone Instance, Clone Name, and mount option. The secondary storage location where cloning is performed is auto-populated.

The screenshot shows the 'Clone from backup' wizard, Step 1: Clone Options. The left sidebar lists steps 1 through 5. The main area is titled 'Clone settings' and includes fields for 'Clone server' (set to 'sql-standby.demo.netapp.com'), 'Clone instance' (set to 'sql-standby'), and 'Clone name' (set to 'tpcc\_dr'). Below this, a section titled 'Choose mount option' offers two choices: 'Auto assign mount point' (selected) and 'Auto assign volume mount point under path' (with a 'full file path' placeholder). The next section, 'Secondary storage location : Snap Vault / Snap Mirror', maps source volumes to destination volumes: 'svm\_onPrem:sql1\_data' to 'svm\_hybridcvo:sql1\_data\_dr', and 'svm\_onPrem:sql1\_log' to 'svm\_hybridcvo:sql1\_log\_dr'. Navigation buttons 'Previous' and 'Next' are at the bottom right.

- Select all log backups to be applied.

7. Specify any optional scripts to run before or after cloning.

Clone from backup x

## Post DR clone validation and configuration for SQL

### 1. Monitor clone job status.

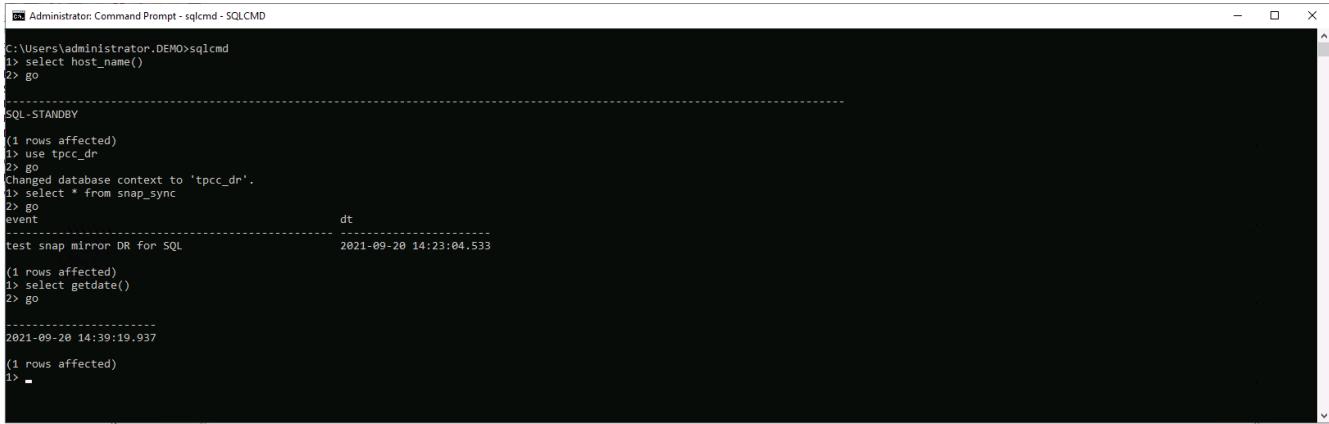

NetApp SnapCenter®

Jobs

Jobs		Schedules	Events	Logs
		search by name		
ID	Status	Jobs - Filter		
1052	✓	Clone from backup 'sql1_tpcc_09-19-2021_18.25.01.4134'		
1047	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		
1045	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		
1044	✓	Clone from backup 'sql1_tpcc_09-17-2021_18.25.01.4218'		
1042	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		
1040	✓	Backup of Resource Group 'sql1_tpcc_log' with policy 'SQL Server Log Backup'		

[Details](#) [Reports](#) [Download Logs](#) [Cancel All](#)

### 2. Validate that last transaction has been replicated and recovered with all log file clones and recovery.

```
C:\Users\administrator.DEMO>sqlcmd
1> select host_name()
2> go
-----
SQL STANDBY
(1 rows affected)
1> use tpcc_dr
2> go
Changed database context to 'tpcc_dr'.
1> select * from snap_sync
2> go
event                                dt
test snap mirror DR for SQL          2021-09-20 14:23:04.533
(1 rows affected)
1> select getdate()
2> go
-----
2021-09-20 14:39:19.937
(1 rows affected)
1> -
```

3. Configure a new SnapCenter log directory on the DR server for SQL Server log backup.
4. Split the cloned volume off of the replicated source volume.
5. Reverse replication from the cloud to on-premises and rebuild the failed on-premises database server.

### Where to go for help?

If you need help with this solution and use cases, please join the [NetApp Solution Automation community support Slack channel](#) and look for the solution-automation channel to post your questions or inquiries.
